1 General Description

This chip is built around an outstanding CPU core: the 16/32 ARM926EJ-S RISC processor designed by Advanced RISC Machines, Ltd. The ARM926EJ-S core, offers 8K-byte I-cache and 8K-byte D-cache with MMU, is a low power, general-purpose integrated circuits. One 10/100 Mb MAC of Ethernet controller is built-in to reduce total system cost. A TFT type LCD controller and 2D graphics engine with various integrated on chip functions, this micro-controller is suitable for a high end, high performance and low cost related products as well as general purpose applications.

The following integrated on-chip functions are described in detail in this document.

	MAIN FUNCTION
CPU	• ARM926EJ-S
Platform	Programmable PLL System Clock Synthesizer
	AMBA Peripherals
	Timer, Watchdog Timer
	Advanced Interrupt Controller
	General DMA Controller
	External Bus Interface Controller
Networking	Ethernet MAC Controller
Display Interface	LCD Controller
Graphics	• 2D Graphic Engine
Audio Interface	• 2-Channel I2S Controller
	• 2-Channel AC97 Controller
USB Interface	USB 1.1/2.0 High/Full/Low Speed Host
	Controller
	USB 2.0 High/Full Speed Device Controller
Storage Interface	NAND Flash Controller with ECC1/ECC4
	SD/SDIO/MMC Controller
	Memory Stick (MS) Controller
Peripheral & Misc.	• GPIO
	• 4-Channel PWM
	UART/HS-UART
	USI (SPI/uWire)
	I2C (Master) Controller
	Keypad Scan Controller

Publication Release Date: Oct 01, 2008

Revision: A2

2 Features

Architecture

- Efficient and powerful ARM926EJ-S core with fully 16/32-bit RISC architecture
- Little Endian mode supported
- 8K-byte I-cache and 8K-byte D-cache with MMU
- Cost-effective JTAG-based debug solution

Power management

- Programmable clock enable for individual peripherals
- IDLE mode to halt ARM Core and keep peripheral working
- Power-Down mode to stop all clocks included external crystal oscillator.
- Exit IDLE/Power-Down by interrupts

PLL

- Supports two on-chip PLLs
- The external clock can be multiplied by on-chip PLL to provide high frequency system clock
- The input frequency range is 4-30MHz; 15MHz is preferred.
- Programmable clock frequency
- Wakeup by interrupt, USB device.

Advanced Interrupt Controller

- 31 interrupt sources, including 3 external interrupt sources
- Programmable normal or fast interrupt mode (IRQ, FIQ)
- Programmable as either edge-triggered or level-sensitive for 3 external interrupt sources
- Programmable as either low-active or high-active for 3 external interrupt sources
- Priority methodology is encoded to allow for interrupt daisy-chaining
- Automatically mask out the lower priority interrupt during interrupt nesting
- Automatically clear the interrupt flag when the interrupt source is programmed to be edge-triggered

General DMA Controller

- 2-channel General DMA for memory-to-memory data transfers without CPU intervention
- Support two external DMA request
- Increments or decrements a source or destination address in 8-bit, 16-bit or 32-bit data transfers
- 8-data burst mode

External Bus Interface

- 8/16/32-bit external bus support for ROM/SRAM, flash memory, SDRAM and external I/Os
- Programmable access cycle (0-7 wait cycle)
- Four-word depth write buffer

Publication Release Date: Oct 01, 2008

Revision: A2

Ethernet MAC Controller

- 100/10-Mbps operation
- DMA engine with burst mode
- MAC Tx/Rx buffers (256 bytes Tx, 256 bytes Rx)
- Full compliance with IEEE standard 802.3
- RMII interface only
- Station Management Signaling
- On-Chip CAM (up to 16 destination addresses)
- Full-duplex mode with PAUSE feature
- Long/short packet modes

LCD Controller

- Support the 8/12/16/18-bit data interface to connect with 80/68 series MPU type LCM module
- Convert RGB-565, YUV-422 display data to RGB-444, RGB-565, RGB-666, YUV-422 color format for display output
- Support CCIR-656(with vsync / hsync / data enable sync signal) 8/16-bit YUV data output format to connect with external TV encoder
- Support 8/16 bpp OSD data with image overlay function to facilitate the diverse graphic UI.
- Support linear 1X 8X image scaling up function.
- Support Picture-In-Picture display function
- Support hardware cursor.

2-D Graphics Engine

- Color depth 8-bit/16-bit/32-bit in RGB domain or RGB332/RGB565/RGB888 are supported
- Contains 2D Bit Block Transfer (BitBLT) functions as defined in Microsoft GDI. It includes HostBLT, Pattern BLT, Color/Font Expanding BLT, Transparent BLT, Tile BLT, Block Move BLT, Copy File BLT, Color/Font Expansion, and Rectangle Fill, etc.
- Supports fore/background colors and all Microsoft 256 ternary raster-operation codes (ROP)
- Clipping window can be defined as inside or outside clipping
- Implements the alpha-blending function for source/destination picture overlaying
- Fast Bresenham line drawing algorithm is used to draw solid/textured lines
- Supports rectangular border or frame drawing
- Supports picture re-sizing by $1/255 \sim 254/255$ down-scaling and $1 \sim 1.996$ up-scaling (1+254/255).
- Supports object rotations in different degrees, that is L45/L90/R45/R90/M180/F180/X180, where
 - ◆ L45/L90 means rotate left 45/90 degrees,
 - ◆ R45/R90 means rotate right 45/90 degrees,
 - ◆ M180 means mirror (flop),
 - ♦ F180 means up-side-down (flip) and X180 for rotations by 180 degrees

2-Channel AC97/I2S Controller

- Support I2S interface.
- Support AC97 interface.
- Built-in an 8x32 bits internal buffer.
- Support DMA function for data transfer between internal buffer and system memory.
- Support 16-bit I2S and MSB-justified format.

Publication Release Date: Oct 01, 2008

Revision: A2

USB Host Controller with transceiver

- Fully compliant with USB Revision 2.0 specification.
- Enhanced Host Controller Interface (EHCI) Revision 1.0 compatible.
- Open Host Controller Interface (OHCI) Revision 1.0 compatible.
- Supports high-speed (480Mbps), full-speed (12Mbps) and low-speed (1.5Mbps) USB devices.
- Supports Control, Bulk, Interrupt, Isochronous and Split transfers.
- Built-in DMA for real-time data transfer.
- Support two ports (one port transceiver is shared with USB Device Controller)

USB Device Controller with transceiver

- Compliant with USB version 2.0 specification.
- Software control for device remote-wakeup.
- Supports 6 configurable IN/OUT endpoints in addition to Control Endpoint. Each of these endpoints can be configures as IN or OUT with Isochronous, Bulk or Interrupt transfer.
- Three different modes of operation of an in-endpoint (Auto validation mode, manual validation mode, Fly mode.
- Supports Endpoint Maximum Packet Size up to 1024 bytes.

Flash Memory Interface (FMI)

- Directly connect to Secure Digital (SD, MMC and SDIO) flash memory card, Memory Stick (Memory stick PRO) and NAND type flash memory.
- Supports DMA function to accelerate the data transfer between the internal buffer, external SDRAM, and flash memory card.
- Two 512 bytes internal buffers are embedded inside

I2C Master

- Compatible with I²C standard, support master mode only
- Multi Master Operation
- Clock stretching and wait state generation
- Provide multi-byte transmit operation, up to 4 bytes can be transmitted in a single transfer
- Software programmable acknowledge bit
- Arbitration lost interrupt, with automatic transfer cancellation
- Start/Stop/Repeated Start/Acknowledge generation
- Start/Stop/Repeated Start detection
- Bus busy detection
- Supports 7 bit addressing mode
- Software mode I²C

Universal Serial Interface (USI)

- Support MICROWIRE/SPI master mode
- Support full/half duplex synchronous serial data transfer
- Variable length of transfer word up to 32 bits
- Provide burst mode operation, transmit/receive can be executed up to four times in one transfer
- MSB or LSB first data transfer
- Receive and Transmit on both rising or falling edge of serial clock independently

Publication Release Date: Oct 01, 2008

Revision: A2

UART

- Three UART (serial I/O) blocks with interrupt-based operation
- Support for 5-bit, 6-bit, 7-bit or 8-bit serial data transmit and receive
- Programmable baud rates
- 1,1½ or 2 stop bits
- Odd or even parity
- Break generation and detection
- Parity, overrun and framing error detection
- X16 clock mode
- Support for IrDA and two debug ports

Timers

- Five programmable 24-bit timers with 8-bit pre-scalar
- One programmable 20-bit Watchdog timer
- One-short mode, period mode or toggle mode operation

4-Channel PWM

- Four 16-bit timers
- Two 8-bit pre-scalars & Two 4-bit divider
- Programmable duty control of output waveform (PWM)
- Auto reload mode or one-shot pulse mode
- Dead-zone generator

Keypad Scan Interface

- Scan up to 16x8 with an external 4 to 16 decoder; or 4x8 array without auxiliary component
- Programmable de-bounce time
- One or two keys scan with interrupt and three keys reset function.
- Support low power wakeup function

Programmable I/Os

- Pins individually configurable to input, output or I/O mode for dedicated signals
- I/O ports are Programmable and Configurable for Multiple functions

Operation Voltage Range

- VDD18 for IO Buffer: 1.8V+/-10%
- VDD33 for Core Logic: 3.3V+/-10%
- USBVDDC0/USBVDDC1/USBVDDT0/USBVDDT1 for USB: 3.3V+/-5%
- PLLVDD18 for PLL: 1.8V+/-10%

Operation Temperature Range

• -20 ° ~ 70 °C

Operating Frequency

Up to 200 MHz for ARM926EJ-S CPU

Package Type

216-Pin LQFP, PB free

Publication Release Date: Oct 01, 2008

5 Pin Description

5.1 Pin Description for Interface

Pin Name	IO Type	Description
Clock & Reset (5)		
EXTAL15M	I	15MHz External Clock / Crystal Input for PLL
XTAL15M	0	15MHz Crystal Output
EXTAL48M0	0	48MHz Crystal Output for USB2.0 PHY
XTAL48M0	I	48MHz Crystal Input for USB2.0 PHY
nRESET	I	System Reset (Low active)
TAP Interface (5)		
тск	ID	JTAG Test Clock, internal pull-down
TMS	IU	JTAG Test Mode Select, internal pull-up
TDI	IU	JTAG Test Data in, internal pull-up
TDO	0	JTAG Test Data out
nTRST	IU	JTAG Reset, active-low, internal pull-up
External Bus Interfac	ce (72)	
MA [21:0]	0	Address Bus of external memory and IO devices.
		(MA[21:13] are set to input mode when nRESET low active)
MD [31:0]	IO (D)	Data Bus of external memory and IO device
		(Pull-down are programmable)
nWBE [3:0] /	0	Write Byte Enable for specific device (nECS [2:0]).
SDQM [3:0]		Data Bus Mask signal for SDRAM (nSCS [1:0]), (Low active)
nSCS [1:0]	0	SDRAM chip select for two external banks, (Low active)
nSRAS	0	Row Address Strobe for SDRAM, (Low active)
nSCAS	0	Column Address Strobe for SDRAM, (Low active)
nSWE	0	SDRAM Write Enable, (Low active)
MCKE	0	SDRAM Clock Enable
MCLK	0	System Master Clock Out, SDRAM clock
nWAIT	IU	External Wait, (Low active), internal pull-up
nBTCS	0	ROM/Flash Chip Select, (Low active)
nECS [2:0]	0	External I/O Chip Select, (Low active)
nOE	0	ROM/Flash, External Memory Output Enable, (Low active)
Ethernet RMII Interf	ace (10)	
PHY_MDC	O(IS)	RMII Management Data Clock
PHY_MDIO	IO(D)	RMII Management Data I/O
		(Pull-down is programmable)
PHY_TXD [1:0]	O(IU)	RMII Transmit Data bus
		(Pull-up are programmable)
PHY_TXEN	O(ID)	RMII Transmit Enable
		(Pull-down is programmable)
PHY_REFCLK	O(ID)	RMII Reference Clock.
		(Pull-down is programmable)
PHY_RXD [1:0]	I(OU)	RMII Receive Data bus
DUN COCON	7/053	(Pull-up are programmable)
PHY_CRSDV	I(OD)	RMII Carrier Sense / Receive Data Valid
DUV DVEDD	T(00)	(Pull-down is programmable)
PHY_RXERR	I(OD)	RMII Receive Data Error
		(Pull-down is programmable)

Publication Release Date: Oct 01, 2008

Revision: A2

AC97/I2S/PWM (5)		
AC97_nRESET /	O(ID)	AC97 Controller RESET Output.
I2S_SYSCLK	- (/	I2S Controller System Clock Output.
		(Pull-down is programmable)
AC97_DATAI /	IO(D)	AC97 Controller Data Input.
I2S_DATAI /	(-,	I2S Controller Data Input.
PWM [0]		PWM Channel 0 Output.
		(Pull-down is programmable)
AC97 DATAO /	O(ID)	AC97 Controller Data Output.
I2S DATAO /	, ,	I2S Controller Data Output.
PWM [1]		PWM Channel 1 Output.
		(Pull-down is programmable)
AC97_SYNC /	IO(D)	AC97 Controller Synchronous Pulse Output.
I2S_WS /	, ,	I2S Controller Word Select.
PWM [2]		PWM Channel 2 Output.
		(Pull-down is programmable)
AC97_BITCLK /	IOSD	AC97 Controller Bit Clock Input.
I2S_BITCLK /		I2S Controller Bit Clock.
PWM [3]		PWM Channel 3 Output.
		(Pull-down with Schmitt trigger input)
USB Interface (10)	-	
DP0	IO	Differential Positive USB Port0 IO signal
DN0	IO	Differential Negative USB Port0 IO signal
REXTO	Α	External Resister Connect for Port0
DP1	IO	Differential Positive USB Port1 IO signal
DN1	IO	Differential Negative USB Port1 IO signal
REXT1	Α	External Resister Connect for Port1
UPWR1	0	USB Port1 Power Control signal
OVI	I	USB Over Current Detection signal
HDS	I	USB PHY 0 Device/Host Mode Select Control signal
UPWR0	0	USB Port0 Power Control signal
		This pin is always driven to Low when USB Port0 is at Device mode
		(the HDS pin at high state)
I2C/USI(SPI/MW) I	nterface (4	
SCL0 /	IOS	I2C Serial Clock Line 0.
SFRM		USI Serial Frame.
		(Input with Schmitt trigger)
SDA0 /	IOS	I2C Serial Data Line 0.
SSPTXD		USI Serial Transmit Data.
		(Input with Schmitt trigger)
SCL1 /	IOS	I2C Serial Clock Line 1.
SCLK		USI Serial Clock.
		(Input with Schmitt trigger)
SDA1 /	IOS	I2C Serial Data Line 1.
SSPRXD		USI Serial Receive Data.
		(Input with Schmitt trigger)
		(Input with Schmitt trigger)

Publication Release Date: Oct 01, 2008

Revision: A2

UARTO/UART1/UART2 Interface (6)			
TXD0	IO(D)	UARTO Transmit Data.	
		(Pull-down is programmable)	
RXD0	IO(D)	UARTO Receive Data.	
		(Pull-down is programmable)	
TXD1	IO(D)	UART1 Transmit Data	
		(Pull-down is programmable)	
RXD1	IO(D)	UART1 Receive Data	
		(Pull-down is programmable)	
TXD2(IrDA)	IO(D)	UART2 Transmit Data supporting SIR IrDA.	
		(Pull-down is programmable)	
RXD2(IrDA)	IO(D)	UART2 Receive Data supporting SIR IrDA.	
		(Pull-down is programmable)	

SD/SDIO/Memory Stick Interface (8)		
SD0_CMD /	IO(U)	SD/SDIO Mode - Command/Response (SPI Mode - Data In)
MS0_BS		Memory Stick Mode – Bus State.
		(Pull-up is programmable)
SD0_CLK /	IO(U)	SD/SDIO Mode - Clock; (SPI Mode - Clock)
MS0_CLK		Memory Stick Mode - Clock
		(Pull-up is programmable)
SD0_DAT0 /	IO(U)	SD/SDIO Mode - Data Line Bit 0;
MS0_DAT0		Memory Stick Mode – Data Line Bit 0;
		(Pull-up is programmable)
SD0_DAT1 /	IO(U)	SD/SDIO Mode - Data Line Bit 1;
MS0_DAT1		Memory Stick Mode – Data Line Bit 1;
		(Pull-up is programmable)
SD0_DAT2 /	IO(U)	SD/SDIO Mode - Data Line Bit 2;
MS0_DAT2		Memory Stick Mode – Data Line Bit 2;
		(Pull-up is programmable)
SDO_DAT3 /	IO(U)	SD/SDIO Mode - Data Line Bit 3;
MS0_DAT3		Memory Stick Mode – Data Line Bit 3;
		(Pull-up is programmable)
SD0_CDn /	IO(U)	SD/SDIO Mode - Card Detect.
MS0_CDn		Memory Stick Mode – Card Detect.
		(Pull-up is programmable)
SD_nPWR	IO(U)	SD/SDIO Power FET Control Signal Output.
		(Pull-up is programmable)

NAND Flash Interfa	NAND Flash Interface (15)		
SM_CS0n	O(IU)	NAND Flash Chip Select #0	
		(Pull-up is programmable)	
SM_ALE	O(IU)	NAND Flash Address Latch Enable	
		(Pull-up is programmable)	
SM_CLE	O(IU)	NAND Flash Command Latch Enable	
		(Pull-up is programmable)	
SM_WEn	O(IU)	NAND Flash Write Enable (Low active)	
		(Pull-up is programmable)	
SM_REn	O(IU)	NAND Flash Read Enable (Low active)	
		(Pull-up is programmable)	
SM_WPn	O(IU)	NAND Flash Write Protect (Low active)	
		(Pull-up is programmable)	
SM_RBn	I(OU)	NAND Flash Busy (Low active)	
		(Pull-up is programmable)	
SM_D[7:0]	IO(U)	NAND Flash Data Bus	
		(Pull-up is programmable)	

Publication Release Date: Oct 01, 2008

Keypad Interface (KPI) (12)		
KPI_COL[7:0]	I	Keypad Column Scan Input Bus This bus is shared with NAND Flash Interface, which is programmable setting.
KPI_ROW[3:0]	0	Keypad Row Scan Output Bus This bus is shared with NAND Flash Interface, which is programmable setting.

LCD Interface (23)			
VD [17:0]	O(IU)	O(IU) LCD Pixel Data Output.	
		(Pull-up is programmable)	
HSYNC	0	Horizontal Sync or Line Sync.	
VSYNC	0	Vertical Sync or Frame Sync.	
VDEN	0	Data Enable or Display Control Signal.	
VOCLK	0	Pixel Clock Output.	
VICLK	IU	Pixel Clock Input.	

Miscellaneous(6)			
nIRQ[2:0]	I(OU)	External Interrupt Request	
		(Pull-up is programmable)	
nWDOG	0	Watchdog Timer Timeout Flag (Low active)	
GPIOE13	IO(U)	Bit 13 of the GPIOE port	
TEST	I	Test Mode	
		This pin has to pull low in normal operation.	
Power/Ground			
VDD18	P	Core Logic power (1.8V)	
VDD33	P	IO Buffer power (3.3V)	
VSS	G	IO Buffer and Core ground (0V)	
USBVDDC0	Р	USB Port0 PHY power (3.3V)	
USBVSSC0	G	USB Port0 PHY ground (0V)	
USBVDDT0	P	USB Port0 PHY Transceiver power (3.3V)	
USBVSST0	G	USB Port0 PHY Transceiver ground (0V)	
USBVDDC1	P	USB Port1 PHY power (3.3V)	
USBVSSC1	G	USB Port1 PHY ground (0V)	
USBVDDT1	P	USB Port1 PHY Transceiver power (3.3V)	
USBVSST1	G	USB Port1 PHY Transceiver ground (0V)	
PLLVDD18	P	PLL power (1.8V)	
PLLVSS18	G	PLL ground (0V)	

Publication Release Date: Oct 01, 2008

Revision: A2

5.2 **GPIO Share Pin Description**

In this chip, there are GPIOC~GPIOH groups for general IO control. All of GPIO pins are shared with the other interface and define as the following

GPIO Group	Shared pin function	
GPIOC (15 pins)	NAND Flash Interface / KPI	
GPIOC[0]	SM_CSOn / KPI ROW[0]	
GPIOC[1]	SM_ALE / KPI_ROW[1]	
GPIOC[2]	SM_CLE / KPI ROW[2]	
GPIOC[3]	SM_WEn / KPI_ROW[3]	
GPIOC[4]	SM_REn	
GPIOC[5]	SM_WPn	
GPIOC[6]	SM_RBn	
GPIOC[7]	SM_D[0] / KPI_COL[0]	
GPIOC[8]	SM_D[1] / KPI COL[1]	
GPIOC[9]	SM_D[2] / KPI_COL[2]	
GPIOC[10]	SM_D[3] / KPI_COL[3]	
GPIOC[11]	SM_D[4] / KPI_COL[4]	
GPIOC[12]	SM_D[5] / KPI_COL[5]	
GPIOC[13]	SM_D[6] / KPI_COL[6]	
GPIOC[14]	SM_D[7] / KPI_COL[7]	

GPIOD (8 pins)	SD(SDIO) / Memory Stick Interface	
GPIOD[0]	SD_CMD / MS_BS	
GPIOD[1]	SD_CLK / MS_CLK	
GPIOD[2]	SD_DATO / MS_DATO	
GPIOD[3]	SD_DAT1 / MS_DAT1	
GPIOD[4]	SD_DAT2 / MS_DAT2	
GPIOD[5]	SD_DAT3 / MS_DAT3	
GPIOD[6]	SD_CDn / MS_CDn	
GPIOD[8]	SD_nPWR / MS_nPWR	

Publication Release Date: Oct 01, 2008

Revision: A2

GPIOE (7 pins)	UART Interface
GPIOE[0]	TXD0
GPIOE[1]	RXD0
GPIOE[2]	TXD1
GPIOE[3]	RXD1
GPIOE[6]	TXD2(IrDA)
GPIOE[7]	RXD2(IrDA)
GPIOE[13]	GPIOE13

GPIOF (10 pins)	RMII Interface
GPIOF [0]	PHY_MDC
GPIOF [1]	PHY_MDIO
GPIOF [3:2]	PHY_TXD [1:0]
GPIOF [4]	PHY_TXEN
GPIOF [5]	PHY_REFCLK
GPIOF [7:6]	PHY_RXD [1:0]
GPIOF [8]	PHY_CRSDV
GPIOF [9]	PHY_RXERR

Publication Release Date: Oct 01, 2008

6 Functional Block

Publication Release Date: Oct 01, 2008

7 Functional Description

7.1 ARM926EJ-S CPU CORE

The ARM926EJ-S CPU core is a member of the ARM9 family of general-purpose microprocessors. The ARM926EJ-S CPU core supports the 32-bit ARM and 16-bit Thumb instruction sets, enabling the user to trade off between high performance and high code density. The ARM926EJ-S processor has a Harvard cached architecture with MMU and provides a complete high-performance processor subsystem.

7.2 System Manager

7.2.1 Overview

The System Manager has the following functions.

- System memory map
- The width of external memory address
- Data bus connection with external memory
- Product identifier register
- Bus arbitration
- PLL module
- Clock select register
- Power-On setting

7.2.2 System Memory Map

This chip provides 2G bytes memory space $(0x0000_0000\sim0x7FFF_FFF)$ for the SDRAM, RAM, ROM and IO Devices, 192M bytes space $(0xB000_0000\sim0xBBFF_FFFF)$ for On-Chip Peripherals and the other memory spaces are reserved.

The size and location of each SDRAM memory bank is determined by the register settings for "current bank base address pointer" and "current bank size" (SDCONF0 and SDCONF1). Please note that when setting the bank control registers, the address boundaries of consecutive banks must not be overlapped.

Except On-Chip Peripherals, the start address of each memory bank is not fixed. You can use bank control registers to assign a specific bank start address by setting the bank's base pointer (13 bits). The address resolution is 256K bytes. The bank's start address is defined as "base pointer << 18", and the bank's size is "current bank size". (EXTOCON \sim EXT2CON)

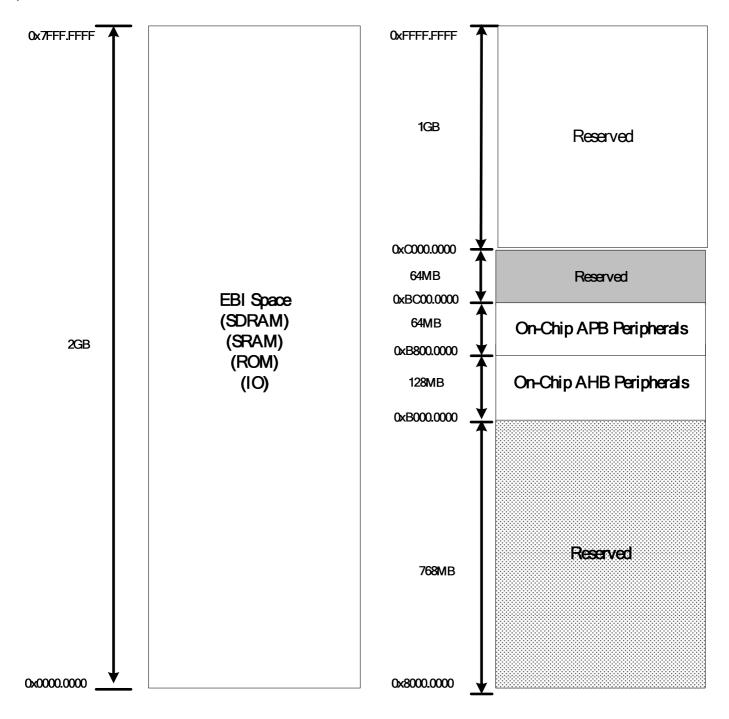

The CPU booting start address is fixed at address 0x0000_0000 after reset or power-on. In the event of an access request to an address outside any programmed bank size, an abort signal is generated. The maximum

31

Publication Release Date: Oct 01, 2008

accessible memory size of each external IO bank is 4MB@8bit (8MB@16bit and 16MB@32bit), and 128M bytes on SDRAM banks.

Publication Release Date: Oct 01, 2008

Revision: A2

7.2.3 Address Bus Generation

The address bus generation is depended on the required data bus width **(DBWD)** and address bus alignment control bit **(ADRS)** of each IO bank.

Address Bus Generation Guidelines (When ADRS bit = 0)

Data Bus Width	External Address Pins MA [21:0]	Maximum Accessible Memory Size
8-bit	MA21 - MA0 (Internal)	4M bytes
16-bit	MA22 – MA1 (Internal)	8M bytes (4M half-words)
32-bit	MA23 – MA2 (Internal)	16M bytes (4M words)

Address Bus Generation Guidelines (When ADRS bit = 1)

Data Bus Width	External Address Pins MA [21:0]	Maximum Accessible Memory Size
8-bit	MA21 - MA0 (Internal)	4M bytes
16-bit	MA21 – MA0 (Internal)	4M bytes, MA[0] ignored (2M half-words)
32-bit	MA21 – MA0 (Internal)	4M bytes, MA[1:0] ignored (1M words)

7.2.4 AHB Bus Arbitration

The system bus is AHB-compliant and supports modules with standard AHB master or slave interfaces. The AHB arbiter has two priority-decision modes, i.e., the fixed priority mode and the rotate priority mode. In the rotate priority mode, there are three types for AHB-Master bus. The selection of modes and types is determined on the **PRTMOD0** and **PRTMOD1**bits in the Arbitration Control Register. **PRTMOD0** is used to control the fixed priority of AHB1 (CPU AHB-Lite) Bus and **PRTMOD1** is used to control the fixed priority of AHB2 Master Bus.

Publication Release Date: Oct 01, 2008

Revision: A2

7.2.4.1 Fixed Priority Mode

Fixed priority mode is selected if PRTMODx = 0. The order of priorities on the AHB mastership among the on-chip master modules is fixed. If two or more master modules request to AHB at the same time, the mastership is always granted to the module with the highest priority.

AHB Bus Priority Order in Fixed Priority Mode

Priority Sequence	PRTMODO = 0 AHB1 Bus	PRTMOD1 = 0 AHB2 Bus
1 (Lowest)	ARM CPU Instruction	AHB Bridge
2	ARM CPU Data	2-D Graphic
3	GDMA0	
4	GDMA1	SDIO(FMI)
5		USB Device
6		USB Host
7		EMC Controller
8		LCD Controller
9 (Highest)		Audio Controller (AC97 & I2S)

The ARM core normally has the lowest priority under the fixed priority mode; however, this chip provides a mechanism to raise the priority to the highest. If the IPEN bit (bit-1 of Arbitration Control Register) is set to 1, the **IPACT** bit (bit-2 of Arbitration Control Register) will be automatically set to 1 while an unmasked external interrupt occurs. Under this circumstance, the ARM core gains the highest AHB priority.

The programmer can recover the original priority order by directly writing "0" to clear the **IPACT** bit. For example, this can be done that at the end of an interrupt service routine. Note that **IPACT** only can be automatically set to 1 by an external interrupt when **IPEN** = 1. It will not take effect if a programmer to directly write 1 to **IPACT** to raise ARM core's AHB priority.

7.2.4.2 Rotate Priority Mode

Rotate priority mode is selected if PRTMODx = 1. The AHB arbiter uses a round robin arbitration scheme by which every master module can gain the bus ownership in turn.

36

For AHB2 DMA Master Bus, the Audio and LCD Display, have the higher priority in the rotate type.

Publication Release Date: Oct 01, 2008

7.2.5 Power-On Setting

After power on reset, Power-On setting registers are latched from EBI Address pins (MA [21:13]) to configure this chip.

Power-On Setting	Pin
Booting Device Select	MA [21:20]
Internal System Clock Select	MA17
GPIO Pin Configuration Select	MA [15:14]
USB PHY0 Mode Select	HDS

MA [21:20] : Booting Device Select

MA[21:20]		Booting Device
Pull-down	Pull-down	SPI Flash ROM
Pull-down	Pull-up	NAND-type Flash ROM
Pull-up	Pull-down	USB ISP
Pull-up	Pull-up	NOR-type Flash ROM

MA19: Pull-up is necessary

MA18: Can either Pull-up or Pull-down

MA17: Internal System Clock Select

If pin MA17 is pull-down, the external clock from EXTAL15M pin is served as internal system clock. If pin MA17 is pull-up, the PLL output clock is used as internal system clock.

MA16: Pull-down is necessary

7.3 Clock Controller

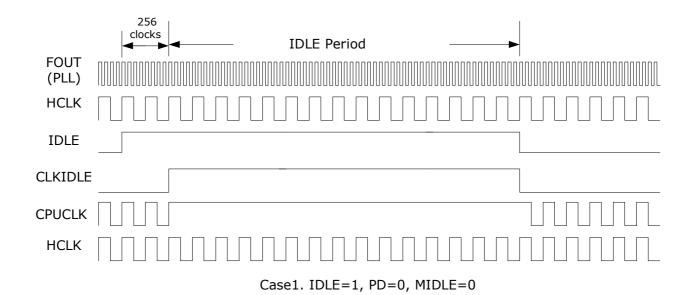

The clock controller generates all clocks for LCD, Audio, CPU, AMBA and all the engine modules. In this chip includes two PLL modules. The clock source for each module is come from the PLL, or from the external crystal input directly. For each clock there is bit on the CLKEN register to control the clock ON or OFF individually, and the divider setting is on the CLKDIV register. The register can also be used to control the clock enable or disable for power control.

7.3.1 Power management

This chip provides three power management scenarios to reduce power consumption. The peripheral clocks can be enabled / disabled individually by controlling the corresponding bit in CLKSEL control register. Software can turn-off the unused modules' clock for power saving. It also provides **IDLE** and **Power-down** modes to reduce the power consumption.

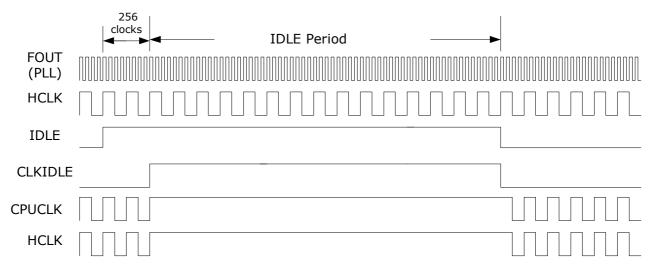

IDLE MODE

If the **IDLE** bit in Power Management Control Register (PMCON) is set, the ARM CORE clock source will be halted after 256 cycles, and then the ARM core will stop. The AHB or APB clocks are still active except the clock to cache controller and ARM core. This ARM core will exit from this mode when a **nIRQ** or **nFIQ** signals from any peripheral, such as Keypad and Timer overflow interrupts. The memory controller can also be forced to enter idle state if both the **MIDLE** and **IDLE** bits are set.

Publication Release Date: Oct 01, 2008

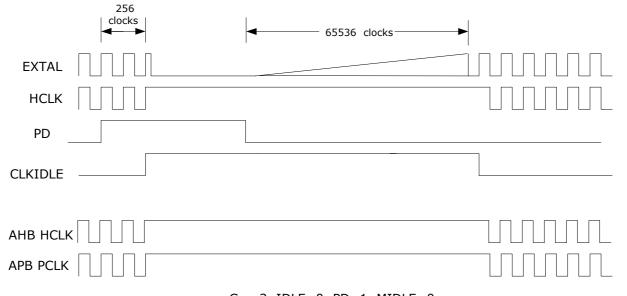

Revision: A2

Case2. IDLE=1, PD=0, MIDLE=1

Power-Down Mode

The mode provides the minimum power consumption. When the system is not working or waiting an external event, software can write PD bit to turn off all the clocks includes system crystal oscillator and PLL to let ARM core to enter sleep mode after 256 clock cycles. In this state, all peripherals are also in sleep mode since the clock source is stopped. This system will exit from this mode when external interrupts (**nIRQ** signals) are detected; this chip provides external interrupts, USB device and Keypad to wakeup the clock.

Case3. IDLE=0, PD=1, MIDLE=0

Publication Release Date: Oct 01, 2008

The formula of output clock of PLL is:

$$Fout = Fin * \frac{NF}{NR} * \frac{1}{NO}$$

FOUT: Output clock of **Output Divider**

FIN: External clock into the **Input Divider** NR : Input divider value (NR = INDV + 2)

NF : Feedback divider value (NF = FBDV + 2)

NO : Output divider value (NO = OTDV)

Example Case:

The input clock frequency of EXTAL15M pin is 15MHz

PLL Output Frequency	200MHz	166MHz	133MHz	100MHz

7.4 External Bus Interface

7.4.1 Overview

This chip supports External Bus Interface (**EBI**), which controls the access to the external memory (ROM/FLASH, SDRAM) and External I/O devices. The **EBI** has chip select signals to select one ROM/FLASH bank, two SDRAM banks, and three External I/O banks with 22-bit address bus. It supports 8-bit, 16-bit, and 32-bit external data bus width for each bank.

The EBI has the following functions:

- SDRAM controller
- EBI control register
- ROM/FLASH interface
- External I/O interface

7.4.2 Functional Description

7.4.2.1 SDRAM Controller

The SDRAM controller module contains configuration registers, timing control registers, common control register and other logic to provide 8, 16, 32 bits SDRAM interface with a single 8, 16, 32 bits SDRAM device or two 8-bit devices wired to give a 16-bit data path or two 16-bit devices wired to give a 32-bit data path.

The SDRAM controller has the following features:

- Supports up to 2 external SDRAM banks
- Maximum size of each SDRAM bank is 128M bytes
- 8、16、32-bit data interface
- Programmable CAS Latency: 1, 2 and 3
- Fixed Burst Length: 1
- Sequential burst type
- Write Burst Length mode is Burst
- Auto Refresh Mode and Self Refresh Mode
- Adjustable Refresh Rate
- Power up sequence

Publication Release Date: Oct 01, 2008

Revision: A2

7.4.2.2 SDRAM Components Supported

Table: SDRAM Components supported

Size	Туре	Banks	Row Addressing	Column Addressing
16M bits	2Mx8	2	RA0~RA10	CA0~CA8

312M DILS	32Mx16	4	RA0~RA12	CA0~CA9

Publication Release Date: Oct 01, 2008

Revision: A2

7.4.2.3 AHB Bus Address Mapping to SDRAM Bus

Note: * indicates the signal is not used; ** indicates the signal is fixed at logic 0 and is not used;

The HADDR prefixes have been omitted on the following tables.

MA14 ~ MA0 are the Address pins of the EBI interface;

MA14 and MA13 are also the bank selected signals of SDRAM.

SDRAM Data Bus Width: 32-bit

7.4.2.4 SDRAM Power-Up Sequence

The default value of the mode register is not defined, therefore the mode register must be written after power up to operate the SDRAM. This chip supports the function of Power-Up Sequence, that is, after system power on, the SDRAM Controller automatically executes the commands needed for Power-Up sequence and set the mode register of each bank to default value. The default value is:

- Burst Length = 1
- Burst Type = Sequential (fixed)
- CAS Latency = 2
- Write Burst Length = Burst (fixed)

The value of mode register can be changed after power up sequence by setting the value of corresponding bank's configuration register "**LENGTH**" and "**LATENCY**" bits and set the **MRSET** bit enable to execute the Mode Register Set command.

7.5 Ethernet MAC Controller

Overview

This chip provides an Ethernet MAC Controller (EMC) for WAN/LAN application. This EMC has its DMA controller, transmit FIFO, and receive FIFO.

The Ethernet MAC controller consists of IEEE 802.3/Ethernet protocol engine with internal CAM function for Ethernet MAC address recognition, Transmit-FIFO, Receive-FIFO, TX/RX state machine controller and status controller. The EMC only supports RMII (Reduced MII) interface to connect with PHY operating on 50MHz REF_CLK.

Features

- Supports IEEE Std. 802.3 CSMA/CD protocol.
- Supports both half and full duplex for 10M/100M bps operation.
- Supports RMII interface.
- Supports MII Management function.
- Supports pause and remote pause function for flow control.
- Supports long frame (more than 1518 bytes) and short frame (less than 64 bytes) reception.
- Supports 16 entries CAM function for Ethernet MAC address recognition.
- Supports internal loop back mode for diagnostic.
- Supports 256 bytes embedded transmit and receive FIFO.
- Supports DMA function.

Publication Release Date: Oct 01, 2008

Revision: A2

7.5.1 EMC Descriptors

A link-list data structure named as descriptor is used to keep the control, status and data information of each frame. Through the descriptor, CPU and EMC exchange the information for frame reception and transmission.

Two different descriptors are defined in W90P950. One named as Rx descriptor for frame reception and the other names as Tx descriptor for frame transmission. Each Rx descriptor consists of four words. There is much information kept in the descriptors and details are described as below.

7.5.1.1 Rx Buffer Descriptor

3 3	2	l 1						
1 0	9	5 5						
0	Rx Status	Receive Byte Count						
Receive Buffer Starting Address								
	Reserved							
	Next Rx Descriptor Starting Address

15	14	13	12	11	10	9	8	
			RI	ВС				
7	6	5	4	3	2	1	0	
	RBC							

Publication Release Date: Oct 01, 2008

Revision: A2

Bits	Descriptions	
[31:30]	Owner	Ownership The ownership field defines which one, the CPU or EMC, is the owner of each Rx descriptor. Only the owner has right to modify the Rx descriptor and the others can read the Rx descriptor only. 00: The owner is CPU 01: Undefined 10: The owner is EMC 11: Undefined If the O=2'b10 indicates the EMC RxDMA is the owner of Rx descriptor and the Rx descriptor is available for frame reception. After the frame reception completed, if the frame needed NAT translation, EMC RxDMA modify ownership field to 2'b11. Otherwise, the ownership field will be modified to 2'b00. If the O=2'b00 indicates the CPU is the owner of Rx descriptor. After the CPU completes processing the frame, it modifies the ownership field to 2'b10 and releases the Rx descriptor to EMC RxDMA.
[29:23]	Rx Status	Receive Status This field keeps the status for frame reception. All status bits are updated by EMC. In the receive status, bits 29 to 23 are undefined and reserved for the future.
[22]	RP	Runt Packet The RP indicates the frame stored in the data buffer pointed by Rx descriptor is a short frame (frame length is less than 64 bytes). 1'b0: The frame is not a short frame. 1'b1: The frame is a short frame.
[21]	ALIE	Alignment Error The ALIE indicates the frame stored in the data buffer pointed by Rx descriptor is not a multiple of byte. 1'b0: The frame is a multiple of byte. 1'b1: The frame is not a multiple of byte.
[20]	RXGD	Frame Reception Complete The RXGD indicates the frame reception has completed and stored in the data buffer pointed by Rx descriptor. 1'b0: The frame reception not complete yet. 1'b1: The frame reception completed.
[19]	PTLE	Packet Too Long The PTLE indicates the frame stored in the data buffer pointed by Rx descriptor is a long frame (frame length is greater than 1518 bytes). 1'b0: The frame is not a long frame. 1'b1: The frame is a long frame.
[17]	CRCE	CRC Error The CRCE indicates the frame stored in the data buffer pointed by Rx descriptor incurred CRC error. 1'b0: The frame doesn't incur CRC error. 1'b1: The frame incurred CRC error.

Publication Release Date: Oct 01, 2008

[16]	RXINTR	Receive Interrupt The RXINTR indicates the frame stored in the data buffer pointed by Rx descriptor caused an interrupt condition. 1'b0: The frame doesn't cause an interrupt. 1'b1: The frame caused an interrupt.
[15:0]	RBC	Receive Byte Count The RBC indicates the byte count of the frame stored in the data buffer pointed by Rx descriptor. The four bytes CRC field is also included in the receive byte count. But if the SPCRC of register MCMDR is enabled, the four bytes CRC field will be excluded from the receive byte count.

Rx Descriptor Word 1

31	30	29	28	27	26	25	24			
	RXBSA									
23	22	21	20	19	18	17	16			
	RXBSA									
15	14	13	12	11	10	9	8			
			RXI	BSA						
7	6	5	4	3	2	1	0			
	RXBSA					В	0			

Bits	Descriptions	
[31:2]	RXBSA	Receive Buffer Starting Address The RXBSA indicates the starting address of the receive frame buffer. The RXBSA is used to be the bit 31 to 2 of memory address. In other words, the starting address of the receive frame buffer always located at word boundary.
[1:0]	во	Byte Offset The BO indicates the byte offset from RXBSA where the received frame begins to store. If the BO is 2'b01, the starting address where the received frame begins to store is RXBSA+2'b01, and so on.

Publication Release Date: Oct 01, 2008

Revision: A2

Rx Descriptor Word 2

31	30	29	28	27	26	25	24			
	Reserved									
23	22	21	20	19	18	17	16			
	Reserved									
15	14	13	12	11	10	9	8			
	Reserved									
7	6	5	4	3	2	1	0			
	Reserved									

The Rx descriptor word 2 keeps obsolete information for MAC translation. Therefore, these information bits are undefined and should be ignored.

Rx Descriptor Word 3

31	30	29	28	27	26	25	24			
	NRXDSA									
23	22	21	20	19	18	17	16			
			NRX	DSA						
15	14	13	12	11	10	9	8			
			NRX	DSA						
7	6	5	4	3	2	1	0			
	NRXDSA									

Bits	Descriptions	
[31:0]	NRXDSA	Next Rx Descriptor Starting Address The Rx descriptor is a link-list data structure. Consequently, NRXDSA is used to keep the starting address of the next Rx descriptor. The bits [1:0] will be ignored by EMC. So, all Rx descriptor must locate at word boundary memory address.

Publication Release Date: Oct 01, 2008

Revision: A2

7.5.1.2 Tx Buffer Descriptor

3	1 1							
1	0 6 5	3	2	1	0			
0	Reserved		Ι	С	Р			
	Reserved Transmit Buffer Starting Address Tx Status Transmit Byte Count			В	0			
	Reserved Transmit Buffer Starting Address							
	Next Tx Descriptor Starting Address							

Tx Descriptor Word 0

31	30	29	28	27	26	25	24			
Owner				Reserved						
23	22	21	20	19	18	17	16			
	Reserved									
15	14	13	12	11	10	9	8			
	Reserved									
7	6	5	4	3	2	1	0			
	Reserved				IntEn	CRCApp	PadEn			

Bits	Descriptions	
[31]	Owner	Ownership The ownership field defines which one, the CPU or EMC, is the owner of each Tx descriptor. Only the owner has right to modify the Tx descriptor and the other can read the Tx descriptor only. 0: The owner is CPU 1: The owner is EMC If the O=1'b1 indicates the EMC TxDMA is the owner of Tx descriptor and the Tx descriptor is available for frame transmission. After the frame transmission completed, EMC TxDMA modify ownership field to 1'b0 and return the ownership of Tx descriptor to CPU. If the O=1'b0 indicates the CPU is the owner of Tx descriptor. After the CPU prepares new frame to wait transmission, it modifies the ownership field to 1'b1 and releases the Tx descriptor to EMC TxDMA.
[2]	IntEn	Transmit Interrupt Enable The IntEn controls the interrupt trigger circuit after the frame transmission completed. If the IntEn is enabled, the EMC will trigger interrupt after frame transmission completed. Otherwise, the interrupt doesn't be triggered. 1'b0: Frame transmission interrupt is masked. 1'b1: Frame transmission interrupt is enabled.

Publication Release Date: Oct 01, 2008

Revision: A2

[1]	СКСАрр	CRC Append The CRCApp control the CRC append during frame transmission. If CRCApp is enabled, the 4-bytes CRC checksum will be appended to frame at the end of frame transmission. 1'b0: 4-bytes CRC appending is disabled. 1'b1: 4-bytes CRC appending is enabled.
[0]	PadEN	Padding Enable The PadEN control the PAD bits appending while the length of transmission frame is less than 60 bytes. If PadEN is enabled, EMC does the padding automatically. 1'b0: PAD bits appending is disabled. 1'b1: PAD bits appending is enabled.

Tx Descriptor Word 1

15	14	13	12	11	10	9	8	
	TBC							
7	6	5	4	3	2	1	0	
	ТВС							

Bits	Descriptions	
[31:28]	CCNT	Collision Count The CCNT indicates the how many collisions occurred consecutively during a packet transmission. If the packet incurred 16 consecutive collisions during transmission, the CCNT will be 4'h0 and bit TXABT will be set to 1.
[26]	SQE	SQE Error The SQE indicates the SQE error found at end of packet transmission on 10Mbps half-duplex mode. The SQE error check will only be done while both bit EnSQE of MCMDR is enabled and EMC is operating on 10Mbps half-duplex mode. 1'b0: No SQE error found at end of packet transmission. 1'b0: SQE error found at end of packet transmission.
[25]	PAU	Transmission Paused The PAU indicates the next normal packet transmission process will be paused temporally because EMC received a PAUSE control frame, or S/W set bit SDPZ of MCMDR and make EMC to transmit a PAUSE control frame out. 1'b0: Next normal packet transmission process will go on. 1'b1: Next normal packet transmission process will be paused.
[24]	ТХНА	P Transmission Halted The TXHA indicates the next normal packet transmission process will be halted because the bit TXON of MCMDR is disabled be S/W. 1'b0: Next normal packet transmission process will go on. 1'b1: Next normal packet transmission process will be halted.
[23]	LC	Late Collision The LC indicates the collision occurred in the outside of 64 bytes collision window. This means after the 64 bytes of a frame has transmitted out to the network, the collision still occurred. The late collision check will only be done while EMC is operating on half-duplex mode. 1'b0: No collision occurred in the outside of 64 bytes collision window. 1'b1: Collision occurred in the outside of 64 bytes collision window.

Publication Release Date: Oct 01, 2008

Revision: A2

[22]	TXABT	Transmission Abort The TXABT indicates the packet incurred 16 consecutive collisions during transmission, and then the transmission process for this packet is aborted. The transmission abort is only available while EMC is operating on half-duplex mode. 1'b0: Packet doesn't incur 16 consecutive collisions during transmission. 1'b1: Packet incurred 16 consecutive collisions during transmission.						
[21]	NCS	No Carrier Sense The NCS indicates the MII I/F signal CRS doesn't active at the start of o during the packet transmission. The NCS is only available while EMC is operating on half-duplex mode. 1'b0: CRS signal actives correctly. 1'b1: CRS signal doesn't active at the start of or during the packet transmission.						
[20]	EXDEF	Defer Exceed The EXDEF indicates the frame waiting for transmission has deferred over 0.32768ms on 100Mbps mode, or 3.2768ms on 10Mbps mode. The deferral exceed check will only be done while bit NDEF of MCMDR is disabled, and EMC is operating on half-duplex mode. 1'b0: Frame waiting for transmission has not deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps). 1'b1: Frame waiting for transmission has deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps).						
[19]	ТХСР	Transmission Complete The TXCP indicates the packet transmission has completed correctly. 1'b0: The packet transmission doesn't complete. 1'b1: The packet transmission has completed.						
[17]	DEF	Transmission Deferred The DEF indicates the packet transmission has deferred once. The DEF is only available while EMC is operating on half-duplex mode. 1'b0: Packet transmission doesn't defer. 1'b1: Packet transmission has deferred once.						
[16]	TXINTR	Transmit Interrupt The TXINTR indicates the packet transmission caused an interrupt condition. 1'b0: The packet transmission doesn't cause an interrupt. 1'b1: The packet transmission caused an interrupt.						
[15:0]	твс	Transmit Byte Count The TBC indicates the byte count of the frame stored in the data buffer pointed by Tx descriptor for transmission.						

Publication Release Date: Oct 01, 2008

Revision: A2

EMC Register Mapping 7.5.2

The EMC implements many registers and the registers are separated into three types, the control registers, the status registers and diagnostic registers. The control registers are used by S/W to pass control information to EMC. The status registers are used to keep EMC operation status for S/W.

EMC Registers

Register	Address	R/W	Description	Reset Value
EMC_BA =	0xB000_3000

7.5.3 EMC Register Details

CAM Command Register (CAMCMR)

The EMC of W90P950 supports CAM function for destination MAC address recognition. The CAMCMR control the CAM comparison function, and unicast, multicast, and broadcast packet reception.

Register	Address	R/W	Description	Reset Value
CAMCMR	0xB000_3000	R/W	CAM Command Register	0x0000_0000

31	30	29	28	27	26	25	24

	Reserved						
15	14	13	12	11	10	9	8
	Reserved						
7	6	5	4	3	2	1	0
Reserved RMII E			ECMP	CCAM	ABP	AMP	AUP

Bits	Descript	ions
[5]	RMII	Enable RMII Input Data Sampled by Negative Edge of REFCLK 1'b0: PHY_CRSDV and PHY_RXD[1:0] are sampled by the positive edge of REFCLK 1'b1: PHY_CRSDV and PHY_RxD[1:0] are sampled by the negative edge of REFCLK
[4]	ЕСМР	Enable CAM Compare The ECMP controls the enable of CAM comparison function for destination MAC address recognition. If S/W wants to receive a packet with specific destination MAC address, configures the MAC address into anyone of 16 CAM entries, then enables that CAM entry and set ECMP to 1. 1'b0: Disable CAM comparison function for destination MAC address recognition. 1'b1: Enable CAM comparison function for destination MAC address recognition.
[3]	ССАМ	Complement CAM Compare The CCAM controls the complement of the CAM comparison result. If the ECMP and CCAM are both enabled, the incoming packet with specific destination MAC address configured in CAM entry will be dropped. And the incoming packet with destination MAC address doesn't configured in any CAM entry will be received. 1'b0: The CAM comparison result doesn't be complemented. 1'b1: The CAM comparison result will be complemented.
[2]	АВР	Accept Broadcast Packet The ABP controls the broadcast packet reception. If ABP is enabled, EMC receives all incoming packet its destination MAC address is a broadcast address. 1'b0: EMC receives packet depends on the CAM comparison result. 1'b1: EMC receives all broadcast packets.

Publication Release Date: Oct 01, 2008

Revision: A2

[1]	АМР	Accept Multicast Packet The AMP controls the multicast packet reception. If AMP is enabled, EMC receives all incoming packet its destination MAC address is a multicast address. 1'b0: EMC receives packet depends on the CAM comparison result. 1'b1: EMC receives all multicast packets.
[0]	AUP	Accept Unicast Packet The AUP controls the unicast packet reception. If AUP is enabled, EMC receives all incoming packet its destination MAC address is a unicast address. 1'b0: EMC receives packet depends on the CAM comparison result. 1'b1: EMC receives all unicast packets.

CAMCMR Setting and Comparison Result

The following table is the address recognition result in different CAMCMR configuration. The column Result shows the incoming packet type that can pass the address recognition in specific CAM configuration. The C, U, M and B represents the:

- C: It indicates the destination MAC address of incoming packet has been configured in CAM entry.
- *U*: It indicates the incoming packet is a unicast packet.
- M: It indicates the incoming packet is a multicast packet.
- B: It indicates the incoming packet is a broadcast packet.

Publication Release Date: Oct 01, 2008

Bits	Descriptio	Descriptions					
[x]	CAM×EN	CAM Entry x Enable The CAMxEN controls the validation of CAM entry x. The x can be 0 to 15. The CAM entry 13, 14 and 15 are for PAUSE control frame transmission. If S/W wants to transmit a PAUSE control frame out to network, the enable bits of these three CAM entries all must be enabled first. 1'b0: CAM entry x is disabled. 1'b1: CAM entry x is enabled.					

Publication Release Date: Oct 01, 2008

Revision: A2

CAM Entry Registers (CAMxx)

In the EMC of W90P950, there are 16 CAM entries. In these 16 CAM entries, 13 entries (entry $0\sim12$) are to keep destination MAC address for packet recognition, and the other 3 entries (entry $13\sim15$) are for PAUSE control frame transmission. Each CAM entry consists of 6 bytes. Consequently, 2 register ports are needed for each CAM entry.

For packet recognition, a register pair {CAMxM, CAMxL} represents a CAM entry and can keep a destination MAC address. The corresponding CAM enable bit CAMxEN of CAMEN register is also needed be enabled. The x can be the 0 to 12.

For PAUSE control frame transmission, first, S/W must configure destination MAC address of control frame into the register pair {CAM13M, CAM13L}, source MAC address into the register pair {CAM14M, CAM14L}, and configure length/type, op-code and operand of control frame into the register pair {CAM15M, CAM15L}. The bit CAM13EN, CAM14EN and CAM15EN of CAMEN register are also needed be enabled. Then, enable the bit SDPZ of MCMDR register.

Register	Address	R/W	Description	Reset Value
CAM0M	0xB000_3008		CAM0 Most Significant Word Register	0x0000_0000
CAM0L	0xB000_300C		CAM0 Least Significant Word Register	0x0000_0000
:	:	R/W	:	:
CAM15M	0xB000_3080		CAM15 Most Significant Word Register	0x0000_0000

	Reserved								

Bits	Descriptions	
[31:16]	Operand	Pause Parameter In the PAUSE control frame, an operand field is defined and controls how much time the destination Ethernet MAC Controller is paused. The unit of the operand is the slot time, the 512 bits time.

Publication Release Date: Oct 01, 2008

Revision: A2

Transmit Descriptor Link List Start Address Register (TXDLSA)

The Tx descriptor defined in EMC is a link-list data structure. The TXDLSA keeps the starting address of this link-list. In other words, the TXDLSA keeps the starting address of the $1^{\rm st}$ Tx descriptor. S/W must configure TXDLSA before enable bit TXON of MCMDR register.

Register	Address	R/W	Description	Reset Value
TXDLSA	0xB000_3088	R/W	Transmit Descriptor Link List Start Address Register	0xFFFF_FFFC

31	30	29	28	27	26	25	24	
TXDLSA								
23	22	21	20	19	18	17	16	
TXDLSA								
15	14	13	12	11	10	9	8	
TXDLSA								
7	6	5	4	3	2	1	0	
TXDLSA								

Bits	Descriptions	
[31:0]	TXDLSA	Transmit Descriptor Link-List Start Address The TXDLSA keeps the start address of transmit descriptor link-list. If the S/W enables the bit TXON of MCMDR register, the content of TXDLSA will be loaded into the current transmit descriptor start address register (CTXDSA). The TXDLSA doesn't be updated by EMC. During the operation, EMC will ignore the bits [1:0] of TXDLSA. This means that each Tx descriptor always must locate at word boundary memory address.

Publication Release Date: Oct 01, 2008

Revision: A2

Receive Descriptor Link List Start Address Register (RXDLSA)

The Rx descriptor defined in EMC is a link-list data structure. The RXDLSA keeps the starting address of this link-list. In other words, the RXDLSA keeps the starting address of the $1^{\rm st}$ Rx descriptor. S/W must configure RXDLSA before enable bit RXON of MCMDR register.

Register	Address	R/W	Description	Reset Value
RXDLSA	0xB000_308C	R/W	Receive Descriptor Link List Start Address Register	0xFFFF_FFFC

31	30	29	28	27	26	25	24
			RXD	LSA			
23	22	21	20	19	18	17	16
	RXDLSA						
15	14	13	12	11	10	9	8
	RXDLSA						
7	6	5	4	3	2	1	0
	RXDLSA						

Bits	Descriptions	
[31:0]	RTXDLSA	Receive Descriptor Link-List Start Address The RXDLSA keeps the start address of receive descriptor link-list. If the S/W enables the bit RXON of MCMDR register, the content of RXDLSA will be loaded into the current receive descriptor start address register (CRXDSA). The RXDLSA doesn't be updated by EMC. During the operation, EMC will ignore the bits [1:0] of RXDLSA. This means that each Rx descriptor always must locate at word boundary memory address.

Publication Release Date: Oct 01, 2008

Revision: A2

MAC Command Register (MCMDR)

The MCMDR provides the control information for EMC. Some command settings affect both frame transmission and reception, such as bit FDUP, the full/half duplex mode selection, or bit OPMOD, the 100/10M bps mode selection. Some command settings control frame transmission and reception separately, likes bit TXON and RXON.

Register	Address	R/W	Description	Reset Value
MCMDR	0xB000_3090	R/W	MAC Command Register	0x0000_0000

31	30	29	28	27	26	25	24
			Reserved				SWR
23	22	21	20	19	18	17	16
Rese	rved	LBK	OPMOD	EnMDC	FDUP	EnSQE	SDPZ
15	14	13	12	11	10	9	8
	Rese					NDEF	TXON
7	6	5	4	3	2	1	0
Rese	Reserved SPCRC			ACP	ARP	ALP	RXON

Bits	Descriptions	
[24]	SWR	Software Reset The SWR implements a reset function to make the EMC return default state. The SWR is a self-clear bit. This means after the software reset finished, the SWR will be cleared automatically. Enable SWR can also reset all control and status registers, exclusive of these two bits EnRMII and OPMOD of MCMDR register. The EMC re-initial is needed after the software reset completed. 1'b0: Software reset completed. 1'b1: Enable software reset.
[21]	LBK	Internal Loop Back Select The LBK enables the EMC operating on internal loop-back mode. If the LBK is enabled, the packet transmitted out will be loop-backed to Rx. If the EMC is operating on internal loop-back mode, it also means the EMC is operating on full-duplex mode and the value of FDUP of MCMDR register is ignored. Beside, the LBK doesn't be affected by SWR bit. 1'b0: The EMC operates in normal mode. 1'b1: The EMC operates in internal loop-back mode.
[20]	ОРМОД	Operation Mode Select The OPMOD defines the EMC is operating on 10M or 100M bps mode. The OPMOD doesn't be affected by SWR bit. 1'b0: The EMC operates on 10Mbps mode. 1'b1: The EMC operates on 100Mbps mode.

Publication Release Date: Oct 01, 2008

Revision: A2

[19]	EnMDC	Enable MDC Clock Generation The EnMDC controls the MDC clock generation for MII Management Interface. If the EnMDC is set to 1, the MDC clock generation is enabled. Otherwise, the MDC clock generation is disabled. Consequently, if S/W wants to access the registers of external PHY through MII Management Interface, the EnMDC must be set to high. 1'b0: Disable MDC clock generation. 1'b1: Enable MDC clock generation.
[18]	FDUP	Full Duplex Mode Select The FDUP controls that EMC is operating on full or half duplex mode. 1'b0: The EMC operates on half duplex mode. 1'b1: The EMC operates on full duplex mode.
[17]	EnSQE	Enable SQE Checking The EnSQE controls the enable of SQE checking. The SQE checking is only available while EMC is operating on 10M bps and half duplex mode. In other words, the EnSQE cannot affect EMC operation, if the EMC is operating on 100M bps or full duplex mode. 1'b0: Disable SQE checking while EMC is operating on 10Mbps and half duplex mode. 1'b1: Enable SQE checking while EMC is operating on 10Mbps and half duplex mode.
[16]	SDPZ	Send PAUSE Frame The SDPZ controls the PAUSE control frame transmission. If S/W wants to send a PAUSE control frame out, the CAM entry 13, 14 and 15 must be configured first and the corresponding CAM enable bit of CAMEN register also must be set. Then, set SDPZ to 1 enables the PAUSE control frame transmission. The SDPZ is a self-clear bit. This means after the PAUSE control frame transmission has completed, the SDPZ will be cleared automatically. It is recommended that only enables SPDZ while EMC is operating on full duplex mode. 1'b0: The PAUSE control frame transmission has completed. 1'b1: Enable EMC to transmit a PAUSE control frame out.
[9]	NDEF	No Defer The NDEF controls the enable of deferral exceed counter. If NDEF is set to high, the deferral exceed counter is disabled. The NDEF is only useful while EMC is operating on half duplex mode. 1'b0: The deferral exceed counter is enabled. 1'b1: The deferral exceed counter is disabled.

Publication Release Date: Oct 01, 2008

Revision: A2

[8]	TXON	Frame Transmission ON The TXON controls the normal packet transmission of EMC. If the TXON is set to high, the EMC starts the packet transmission process, including the Tx descriptor fetching, packet transmission and Tx descriptor modification. It is must to finish EMC initial sequence before enable TXON. Otherwise, the EMC operation is undefined. If the TXON is disabled during EMC is transmitting a packet out, the EMC stops the packet transmission process after the current packet transmission finished. 1'b0: The EMC stops packet transmission process. 1'b1: The EMC starts packet transmission process.
[5]	SPCRC	Strip CRC Checksum The SPCRC controls if the length of incoming packet is calculated with 4 bytes CRC checksum. If the SPCRC is set to high, 4 bytes CRC checksum is excluded from length calculation of incoming packet. 1'b0: The 4 bytes CRC checksum is included in packet length calculation. 1'b1: The 4 bytes CRC checksum is excluded in packet length calculation.
[4]	AEP	Accept CRC Error Packet The AEP controls the EMC accepts or drops the CRC error packet. If the AEP is set to high, the incoming packet with CRC error will be received by EMC as a good packet. 1'b0: The CRC error packet will be dropped by EMC. 1'b1: The CRC error packet will be accepted by EMC.
[3]	АСР	Accept Control Packet The ACP controls the control frame reception. If the ACP is set to high, the EMC will accept the control frame. Otherwise, the control frame will be dropped. It is recommended that S/W only enable AEP while EMC is operating on full duplex mode. 1'b0: The control frame will be dropped by EMC. 1'b1: The control frame will be accepted by EMC.
[2]	ARP	Accept Runt Packet The ARP controls the runt packet, which length is less than 64 bytes, reception. If the ARP is set to high, the EMC will accept the runt packet. Otherwise, the runt packet will be dropped. 1'b0: The runt packet will be dropped by EMC. 1'b1: The runt packet will be accepted by EMC.
[1]	ALP	Accept Long Packet The ALP controls the long packet, which packet length is greater than 1518 bytes, reception. If the ALP is set to high, the EMC will accept the long packet. Otherwise, the long packet will be dropped. 1'b0: The long packet will be dropped by EMC. 1'b1: The long packet will be accepted by EMC.

Publication Release Date: Oct 01, 2008

Revision: A2

[0] R)	XON	Frame Reception ON The RXON controls the normal packet reception of EMC. If the RXON is set to high, the EMC starts the packet reception process, including the Rx descriptor fetching, packet reception and Rx descriptor modification. It is must to finish EMC initial sequence before enable RXON. Otherwise, the EMC operation is undefined. If the RXON is disabled during EMC is receiving an incoming packet, the EMC stops the packet reception process after the current packet reception finished. 1'b0: The EMC stops packet reception process. 1'b1: The EMC starts packet reception process.

Revision: A2

MII Management Data Register (MIID)

The EMC provides MII management function to access the control and status registers of the external PHY. The MIID register is used to store the data that will be written into the registers of external PHY for write command or the data that is read from the registers of external PHY for read command.

Register	Address	R/W	R/W Description	
MIID	0xB000_3094	R/W	MII Management Data Register	0x0000_0000

7	6	5	4	3	2	1	0
	MIIData						

Bits	Descriptions	
[15:0]	MIIData	MII Management Data The MIIData is the 16 bits data that will be written into the registers of external PHY for MII Management write command or the data from the registers of external PHY for MII Management read command.

Publication Release Date: Oct 01, 2008

Revision: A2

MII Management Control and Address Register (MIIDA)

The EMC provides MII management function to access the control and status registers of the external PHY. The MIIDA register is used to keep the MII management command information, like the register address, external PHY address, MDC clocking rate, read/write etc.

Register	Address	R/W	Description	Reset Value
MIIDA	0xB000_3098	R/W	MII Management Control and Address Register	0x0090_0000

Publication Release Date: Oct 01, 2008

Revision: A2

[19]	MDCON	MDC Clock ON Always The MDC controls the MDC clock generation. If the MDCON is set to high, the MDC clock actives always. Otherwise, the MDC will only active while S/W issues a MII management command. 1'b0: The MDC clock will only active while S/W issues a MII management command. 1'b1: The MDC clock actives always.
[18]	PreSP	Preamble Suppress The PreSP controls the preamble field generation of MII management frame. If the PreSP is set to high, the preamble field generation of MII management frame is skipped. 1'b0: Preamble field generation of MII management frame is not skipped. 1'b1: Preamble field generation of MII management frame is skipped.
[17]	BUSY	Busy Bit The BUSY controls the enable of the MII management frame generation. If S/W wants to access registers of external PHY, it set BUSY to high and EMC generates the MII management frame to external PHY through MII Management I/F. The BUSY is a self-clear bit. This means the BUSY will be cleared automatically after the MII management command finished. 1'b0: The MII management has finished. 1'b1: Enable EMC to generate a MII management command to external PHY.
[16]	Write	Write Command The Write defines the MII management command is a read or write. 1'b0: The MII management command is a read command. 1'b1: The MII management command is a write command.
[12:8]	PHYAD	PHY Address The PHYAD keeps the address to differentiate which external PHY is the target of the MII management command.
[4:0]	PHYRAD	PHY Register Address The PHYRAD keeps the address to indicate which register of external PHY is the target of the MII management command.

Publication Release Date: Oct 01, 2008

Revision: A2

MII Management Function Frame Format

In IEEE Std. 802.3 clause 22.2.4, the MII management function is defined. The MII management function is used for the purpose of controlling the PHY and gathering status from the PHY. The MII management frame format is shown as follow.

	Management frame fields							
	PRE ST OP PHYAD REGAD TA DATA						IDLE	
READ	11	01	10	AAAAA	RRRRR	Z0	DDDDDDDDDDDDDD	Z
WRITE	11	01	01	AAAAA	RRRRR	10	DDDDDDDDDDDDDD	Z

MII Management Function Configure Sequence

	Read		Write
1.	Set appropriate MDCCR.	1.	Write data to MIID register
2.	Set PHYAD and PHYRAD.	2.	Set appropriate MDCCR.
3.	Set Write to 1'b0	3.	Set PHYAD and PHYRAD.
4.	Set bit BUSY to 1'b1 to send a MII	4.	Set Write to 1'b1
	management frame out.	5.	Set bit BUSY to 1'b1 to send a
5.	Wait BUSY to become 1'b0.		MII management frame out.
6.	Read data from MIID register.	6.	Wait BUSY to become 1'b0.
7.	Finish the read command.	7.	Finish the write command.

Publication Release Date: Oct 01, 2008

Revision: A2

FIFO Threshold Control Register (FFTCR)

The FFTCR defines the high and low threshold of internal FIFO, including TxFIFO and RxFIFO. The threshold of internal FIFO is related to EMC request generation and when the frame transmission starts. The FFTCR also defines the burst length of AHB bus cycle for system memory access.

Register	Address	R/W	Description	Reset Value
FFTCR	0xB000_309C	R/W	FIFO Threshold Control Register	0x0000_0101

31	30	29	28	27	26	25	24		
	Reserved								
23	22	21	20	19	18	17	16

		Rese	rved			TxT	ГНО		
7	6	5	4	3	2	1	0		
	Reserved					Rx	ГНО		

Bits	Descriptions	
[21:20]	Blength	DMA Burst Length The Blength defines the burst length of AHB bus cycle while EMC accesses system memory. 2'b00: 4 words 2'b01: 8 words 2'b10: 16 words 2'b11: 16 words
[9:8]	TxTHD	TxFIFO Low Threshold Default Value: 2'b01 The TxTHD controls when TxDMA requests internal arbiter for data transfer between system memory and TxFIFO. The TxTHD defines not only the low threshold of TxFIFO, but also the high threshold. The high threshold is the twice of low threshold always. During the packet transmission, if the TxFIFO reaches the high threshold, the TxDMA stops generate request to transfer frame data from system memory to TxFIFO. If the frame data in TxFIFO is less than low threshold, TxDMA starts to transfer frame data from system memory to TxFIFO. The TxTHD also defines when the TxMAC starts to transmit frame out to network. The TxMAC starts to transmit the frame out while the TxFIFO first time reaches the high threshold during the transmission of the frame. If the frame data length is less than TxFIFO high threshold, the TxMAC starts to transmit the frame out after the frame data are all inside the TxFIFO. 2'b00: Undefined. 2'b01: TxFIFO low threshold is 64B and high threshold is 128B. 2'b10: TxFIFO low threshold is 80B and high threshold is 160B. 2'b11: TxFIFO low threshold is 96B and high threshold is 192B.

Publication Release Date: Oct 01, 2008

Revision: A2

[1:0]	RxTHD	RxFIFO High Threshold Default Value: 2'b01 The RxTHD controls when RxDMA requests internal arbiter for data transfer between RxFIFO and system memory. The RxTHD defines not only the high threshold of RxFIFO, but also the low threshold. The low threshold is the half of high threshold always. During the packet reception, if the RxFIFO reaches the high threshold, the RxDMA starts to transfer frame data from RxFIFO to system memory. If the frame data in RxFIFO is less than low threshold, RxDMA stops to transfer the frame data to system memory. 2'b00: Depend on the burst length setting. If the burst length is 8 words, high threshold is 8 words, too. 2'b01: RxFIFO high threshold is 64B and low threshold is 32B. 2'b10: RxFIFO high threshold is 128B and low threshold is 96B.

Transmit Start Demand Register (TSDR)

If the Tx descriptor is not available for use of TxDMA after the TXON of MCMDR register is enabled, the FSM (Finite State Machine) of TxDMA enters the Halt state and the frame transmission is halted. After the S/W has prepared the new Tx descriptor for frame transmission, it must issue a write command to TSDR register to make TxDMA leave Halt state and contiguous frame transmission. The TSDR is a write only register and read from this register is undefined. The write to TSDR register has took effect only while TxDMA stayed at Halt state.

			RX	MS			

Bits	Descriptions	
[15:0]	RXMS	Maximum Receive Frame Length Default Value: 16'h0800 The RXMS defines the maximum frame length for received frame. If the frame length of received frame is greater than RXMS, and bit EnDFO of MIEN register is also enabled, the bit DFOI of MISTA register is set and the Rx interrupt is triggered. It is recommended that only use RXMS to qualify the length of received frame while S/W wants to receive a frame which length is greater than 1518 bytes.

Publication Release Date: Oct 01, 2008

Revision: A2

MAC Interrupt Enable Register (MIEN)

The MIEN controls the enable of EMC interrupt status to generate interrupt. Two interrupts, RXINTR for frame reception and TXINTR for frame transmission, are generated from EMC to CPU.

Register	Address	R/W	Description	Reset Value
MIEN	0xB000_30AC	R/W	MAC Interrupt Enable Register	0x0000_0000

31	30	29	28	27	26	25	24

Bits	Descriptions	
[24]	EnTxBErr	Enable Transmit Bus Error Interrupt The EnTxBErr controls the TxBErr interrupt generation. If TxBErr of MISTA register is set, and both EnTxBErr and EnTXINTR are enabled, the EMC generates the Tx interrupt to CPU. If EnTxBErr or EnTXINTR is disabled, no Tx interrupt is generated to CPU even the TxBErr of MISTA register is set. 1'b0: TxBErr of MISTA register is masked from Tx interrupt generation. 1'b1: TxBErr of MISTA register can participate in Tx interrupt generation.
[23]	EnTDU	Enable Transmit Descriptor Unavailable Interrupt The EnTDU controls the TDU interrupt generation. If TDU of MISTA register is set, and both EnTDU and EnTXINTR are enabled, the EMC generates the Tx interrupt to CPU. If EnTDU or EnTXINTR is disabled, no Tx interrupt is generated to CPU even the TDU of MISTA register is set. 1'b0: TDU of MISTA register is masked from Tx interrupt generation. 1'b1: TDU of MISTA register can participate in Tx interrupt generation.
[22]	EnLC	Enable Late Collision Interrupt The EnLC controls the LC interrupt generation. If LC of MISTA register is set, and both EnLC and EnTXINTR are enabled, the EMC generates the Tx interrupt to CPU. If EnLC or EnTXINTR is disabled, no Tx interrupt is generated to CPU even the LC of MISTA register is set. 1'b0: LC of MISTA register is masked from Tx interrupt generation. 1'b1: LC of MISTA register can participate in Tx interrupt generation.
[21]	EnTXABT	Enable Transmit Abort Interrupt The EnTXABT controls the TXABT interrupt generation. If TXABT of MISTA register is set, and both EnTXABT and EnTXINTR are enabled, the EMC generates the Tx interrupt to CPU. If EnTXABT or EnTXINTR is disabled, no Tx interrupt is generated to CPU even the TXABT of MISTA register is set. 1'b0: TXABT of MISTA register is masked from Tx interrupt generation. 1'b1: TXABT of MISTA register can participate in Tx interrupt generation.

Publication Release Date: Oct 01, 2008

Revision: A2

[20]	EnNCS	Enable No Carrier Sense Interrupt The EnNCS controls the NCS interrupt generation. If NCS of MISTA register is set, and both EnNCS and EnTXINTR are enabled, the EMC generates the Tx interrupt to CPU. If EnNCS or EnTXINTR is disabled, no Tx interrupt is generated to CPU even the NCS of MISTA register is set. 1'b0: NCS of MISTA register is masked from Tx interrupt generation. 1'b1: NCS of MISTA register can participate in Tx interrupt generation.
[19]	EnEXDEF	Enable Defer Exceed Interrupt The EnEXDEF controls the EXDEF interrupt generation. If EXDEF of MISTA register is set, and both EnEXDEF and EnTXINTR are enabled, the EMC generates the Tx interrupt to CPU. If EnEXDEF or EnTXINTR is disabled, no Tx interrupt is generated to CPU even the EXDEF of MISTA register is set. 1'b0: EXDEF of MISTA register is masked from Tx interrupt generation. 1'b1: EXDEF of MISTA register can participate in Tx interrupt generation.
[18]	EnTXCP	Enable Transmit Completion Interrupt The EnTXCP controls the TXCP interrupt generation. If TXCP of MISTA register is set, and both EnTXCP and EnTXINTR are enabled, the EMC generates the Tx interrupt to CPU. If EnTXCP or EnTXINTR is disabled, no Tx interrupt is generated to CPU even the TXCP of MISTA register is set. 1'b0: TXCP of MISTA register is masked from Tx interrupt generation. 1'b1: TXCP of MISTA register can participate in Tx interrupt generation.
[17]	EnTXEMP	Enable Transmit FIFO Underflow Interrupt The EnTXEMP controls the TXEMP interrupt generation. If TXEMP of MISTA register is set, and both EnTXEMP and EnTXINTR are enabled, the EMC generates the Tx interrupt to CPU. If EnTXEMP or EnTXINTR is disabled, no Tx interrupt is generated to CPU even the TXEMP of MISTA register is set. 1'b0: TXEMP of MISTA register is masked from Tx interrupt generation. 1'b1: TXEMP of MISTA register can participate in Tx interrupt generation.
[16]	EnTXINTR	Enable Transmit Interrupt The EnTXINTR controls the Tx interrupt generation. If EnTXINTR is enabled and TXINTR of MISTA register is high, EMC generates the Tx interrupt to CPU. If EnTXINTR is disabled, no Tx interrupt is generated to CPU even the status bits 17~24 of MISTA are set and the corresponding bits of MIEN are enabled. In other words, if S/W wants to receive Tx interrupt from EMC, this bit must be enabled. And, if S/W doesn't want to receive any Tx interrupt from EMC, disables this bit. 1'b0: TXINTR of MISTA register is masked and Tx interrupt generation is disabled. 1'b1: TXINTR of MISTA register is unmasked and Tx interrupt generation is enabled.
[14]	EnCFR	Enable Control Frame Receive Interrupt The EnCFR controls the CFR interrupt generation. If CFR of MISTA register is set, and both EnCFR and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnCFR or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the CFR of MISTA register is set. 1'b0: CFR of MISTA register is masked from Rx interrupt generation. 1'b1: CFR of MISTA register can participate in Rx interrupt generation.

Publication Release Date: Oct 01, 2008

Revision: A2

[11]	EnRxBErr	Enable Receive Bus Error Interrupt The EnRxBErr controls the RxBerr interrupt generation. If RxBErr of MISTA register is set, and both EnRxBErr and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnRxBErr or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the RxBErr of MISTA register is set. 1'b0: RxBErr of MISTA register is masked from Rx interrupt generation. 1'b1: RxBErr of MISTA register can participate in Rx interrupt generation.
[10]	EnRDU	Enable Receive Descriptor Unavailable Interrupt The EnRDU controls the RDU interrupt generation. If RDU of MISTA register is set, and both EnRDU and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnRDU or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the RDU of MISTA register is set. 1'b0: RDU of MISTA register is masked from Rx interrupt generation. 1'b1: RDU of MISTA register can participate in Rx interrupt generation.
[9]	EnDEN	Enable DMA Early Notification Interrupt The EnDEN controls the DENI interrupt generation. If DENI of MISTA register is set, and both EnDEN and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnDEN or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the DENI of MISTA register is set. 1'b0: DENI of MISTA register is masked from Rx interrupt generation. 1'b1: DENI of MISTA register can participate in Rx interrupt generation.
		Enable Maximum Frame Length Interrupt The EnDFO controls the DFOI interrupt generation. If DFOI of MISTA register
[8]	EnDFO	is set, and both EnDFO and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnDFO or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the DFOI of MISTA register is set. 1'b0: DFOI of MISTA register is masked from Rx interrupt generation. 1'b1: DFOI of MISTA register can participate in Rx interrupt generation.
[8]	EnDFO EnMMP	interrupt to CPU. If EnDFO or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the DFOI of MISTA register is set. 1'b0: DFOI of MISTA register is masked from Rx interrupt generation.

Publication Release Date: Oct 01, 2008

Revision: A2

[5]	EnALIE	Enable Alignment Error Interrupt The EnALIE controls the ALIE interrupt generation. If ALIE of MISTA register is set, and both EnALIE and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnALIE or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the ALIE of MISTA register is set. 1'b0: ALIE of MISTA register is masked from Rx interrupt generation. 1'b1: ALIE of MISTA register can participate in Rx interrupt generation.
[4]	EnRXGD	Enable Receive Good Interrupt The EnRXGD controls the RXGD interrupt generation. If RXGD of MISTA register is set, and both EnRXGD and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnRXGD or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the RXGD of MISTA register is set. 1'b0: RXGD of MISTA register is masked from Rx interrupt generation. 1'b1: RXGD of MISTA register can participate in Rx interrupt generation.
[3]	EnPTLE	Enable Packet Too Long Interrupt The EnPTLE controls the PTLE interrupt generation. If PTLE of MISTA register is set, and both EnPTLE and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnPTLE or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the PTLE of MISTA register is set. 1'b0: PTLE of MISTA register is masked from Rx interrupt generation. 1'b1: PTLE of MISTA register can participate in Rx interrupt generation.
[2]	EnRXOV	Enable Receive FIFO Overflow Interrupt The EnRXOV controls the RXOV interrupt generation. If RXOV of MISTA register is set, and both EnRXOV and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnRXOV or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the RXOV of MISTA register is set. 1'b0: RXOV of MISTA register is masked from Rx interrupt generation. 1'b1: RXOV of MISTA register can participate in Rx interrupt generation.
[1]	EnCRCE	Enable CRC Error Interrupt The EnCRCE controls the CRCE interrupt generation. If CRCE of MISTA register is set, and both EnCRCE and EnTXINTR are enabled, the EMC generates the Rx interrupt to CPU. If EnCRCE or EnTXINTR is disabled, no Rx interrupt is generated to CPU even the CRCE of MISTA register is set. 1'b0: CRCE of MISTA register is masked from Rx interrupt generation. 1'b1: CRCE of MISTA register can participate in Rx interrupt generation.
[0]	EnRXINTR	Enable Receive Interrupt The EnRXINTR controls the Rx interrupt generation. If EnRXINTR is enabled and RXINTR of MISTA register is high, EMC generates the Rx interrupt to CPU. If EnRXINTR is disabled, no Rx interrupt is generated to CPU even the status bits 1~14 of MISTA are set and the corresponding bits of MIEN are enabled. In other words, if S/W wants to receive Rx interrupt from EMC, this bit must be enabled. And, if S/W doesn't want to receive any Rx interrupt from EMC, disables this bit. 1'b0: RXINTR of MISTA register is masked and Rx interrupt generation is disabled. 1'b1: RXINTR of MISTA register is unmasked and Rx interrupt generation is enabled.

Publication Release Date: Oct 01, 2008

Revision: A2

MAC Interrupt Status Register (MISTA)

The MISTA keeps much EMC statuses, like frame transmission and reception status, internal FIFO status and also NATA processing status. The statuses kept in MISTA will trigger the reception or transmission interrupt. The MISTA is a write clear register and write 1 to corresponding bit clears the status and also clears the interrupt.

Register	Address	R/W	Description	Reset Value
MISTA	0xB000_30B0	R/W	MAC Interrupt Status Register	0x0000_0000

31	30	29	28	27	26	25	24
	Reserved						TxBErr
23	22	21	20	19	18	17	16
TDU	LC	TXABT	NCS	EXDEF	TXCP	TXEMP	TXINTR
15	14	13	12	11	10	9	8
Reserved	CFR	Rese	rved	RxBErr	RDU	DENI	DFOI
7	6	5	4	3	2	1	0
MMP	RP	ALIE	RXGD	PTLE	RXOV	CRCE	RXINTR

Bits	Descriptions	
[24]	TxBErr	Transmit Bus Error Interrupt The TxBErr high indicates the memory controller replies ERROR response while EMC access system memory through TxDMA during packet transmission process. Reset EMC is recommended while TxBErr status is high. If the TxBErr is high and EnTxBErr of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TxBErr status. 1'b0: No ERROR response is received. 1'b1: ERROR response is received.
[23]	TDU	Transmit Descriptor Unavailable Interrupt The TDU high indicates that there is no available Tx descriptor for packet transmission and TxDMA will stay at Halt state. Once, the TxDMA enters the Halt state, S/W must issues a write command to TSDR register to make TxDMA leave Halt state while new Tx descriptor is available. If the TDU is high and EnTDU of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TDU status. 1'b0: Tx descriptor is available. 1'b1: Tx descriptor is unavailable.
[22]	LC	Late Collision Interrupt The LC high indicates the collision occurred in the outside of 64 bytes collision window. This means after the 64 bytes of a frame has transmitted out to the network, the collision still occurred. The late collision check will only be done while EMC is operating on half-duplex mode. If the LC is high and EnLC of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the LC status. 1'b0: No collision occurred in the outside of 64 bytes collision window. 1'b1: Collision occurred in the outside of 64 bytes collision window.

Publication Release Date: Oct 01, 2008

Revision: A2

[21]	TXABT	Transmit Abort Interrupt The TXABT high indicates the packet incurred 16 consecutive collisions during transmission, and then the transmission process for this packet is aborted. The transmission abort is only available while EMC is operating on half-duplex mode. If the TXABT is high and EnTXABT of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TXABT status. 1'b0: Packet doesn't incur 16 consecutive collisions during transmission. 1'b1: Packet incurred 16 consecutive collisions during transmission.
[20]	NCS	No Carrier Sense Interrupt The NCS high indicates the MII I/F signal CRS doesn't active at the start of or during the packet transmission. The NCS is only available while EMC is operating on half-duplex mode. If the NCS is high and EnNCS of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the NCS status. 1'b0: CRS signal actives correctly. 1'b1: CRS signal doesn't active at the start of or during the packet transmission.
[19]	EXDEF	Defer Exceed Interrupt The EXDEF high indicates the frame waiting for transmission has deferred over 0.32768ms on 100Mbps mode, or 3.2768ms on 10Mbps mode. The deferral exceed check will only be done while bit NDEF of MCMDR is disabled, and EMC is operating on half-duplex mode. If the EXDEF is high and EnEXDEF of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the EXDEF status. 1'b0: Frame waiting for transmission has not deferred over 0.32768ms (100Mbps) or 3.2768ms (10Mbps).
[18]	ТХСР	Transmit Completion Interrupt The TXCP indicates the packet transmission has completed correctly. If the TXCP is high and EnTXCP of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TXCP status. 1'b0: The packet transmission doesn't complete. 1'b1: The packet transmission has completed.
[17]	ТХЕМР	Transmit FIFO Underflow Interrupt The TXEMP high indicates the TxFIFO underflow occurred during packet transmission. While the TxFIFO underflow occurred, the EMC will retransmit the packet automatically without S/W intervention. If the TxFIFO underflow occurred often, it is recommended that modify TxFIFO threshold control, the TxTHD of FFTCR register, to higher level. If the TXEMP is high and EnTXEMP of MIEN register is enabled, the TxINTR will be high. Write 1 to this bit clears the TXEMP status. 1'b0: No TxFIFO underflow occurred during packet transmission. 1'b0: TxFIFO underflow occurred during packet transmission.

Publication Release Date: Oct 01, 2008

Revision: A2

		,
[16]	TXINTR	Transmit Interrupt The TXINTR indicates the Tx interrupt status. If TXINTR high and its corresponding enable bit, EnTXINTR of MISTA register, is also high indicates the EMC generates Tx interrupt to CPU. If TXINTR is high but EnTXINTR of MISTA is disabled, no Tx interrupt is generated. The TXINTR is logic OR result of the bits 17~24 in MISTA register do logic AND with the corresponding bits in MIEN register. In other words, if one of the bits 17~24 in MISTA register is high and its corresponding enable bit in MIEN register is also enabled, the TXINTR will be high. Because the TXINTR is a logic OR result, clears bits 17~24 of MISTA register makes TXINTR be cleared, too. 1'b0: No status of bits 17~24 in MISTA is set or no enable of bits 17~24 in MIEN is turned on. 1'b1: At least one status of bits 17~24 in MISTA is set and its corresponding enable bit is turned on.
[14]	CFR	Control Frame Receive Interrupt The CFR high indicates EMC receives a flow control frame. The CFR only available while EMC is operating on full duplex mode. If the CFR is high and EnCFR of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the CFR status. 1'b0: The EMC doesn't receive the flow control frame. 1'b1: The EMC receives a flow control frame.
[11]	RxBErr	Receive Bus Error Interrupt The RxBErr high indicates the memory controller replies ERROR response while EMC access system memory through RxDMA during packet reception process. Reset EMC is recommended while RxBErr status is high. If the RxBErr is high and EnRxBErr of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RxBErr status. 1'b0: No ERROR response is received. 1'b1: ERROR response is received.
[10]	RDU	Receive Descriptor Unavailable Interrupt The RDU high indicates that there is no available Rx descriptor for packet reception and RxDMA will stay at Halt state. Once, the RxDMA enters the Halt state, S/W must issues a write command to RSDR register to make RxDMA leave Halt state while new Rx descriptor is available. If the RDU is high and EnRDU of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RDU status. 1'b0: Rx descriptor is available. 1'b1: Rx descriptor is unavailable.
[9]	DENI	DMA Early Notification Interrupt The DENI high indicates the EMC has received the Length/Type field of the incoming packet. If the DENI is high and EnDENI of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the DENI status. 1'b0: The Length/Type field of incoming packet has not received yet. 1'b1: The Length/Type field of incoming packet has received.

Publication Release Date: Oct 01, 2008

Revision: A2

		Maximum Frame Length Interrupt
[8]	DFOI	The DFOI high indicates the length of the incoming packet has exceeded the length limitation configured in DMARFC register and the incoming packet is dropped. If the DFOI is high and EnDFO of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the DFOI status. 1'b0: The length of the incoming packet doesn't exceed the length limitation configured in DMARFC. 1'b1: The length of the incoming packet has exceeded the length limitation configured in DMARFC.
[7]	ММР	More Missed Packet Interrupt The MMP high indicates the MPCNT, Missed Packet Count, has overflow. If the MMP is high and EnMMP of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the MMP status. 1'b0: The MPCNT has not rolled over yet. 1'b1: The MPCNT has rolled over yet.
[6]	RP	Runt Packet Interrupt The RP high indicates the length of the incoming packet is less than 64 bytes, and the packet is dropped. If the ARP of MCMDR register is set, the short packet is regarded as a good packet and RP will not be set. If the RP is high and EnRP of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RP status. 1'b0: The incoming frame is not a short frame or S/W wants to receive a short frame. 1'b1: The incoming frame is a short frame and dropped.
[5]	ALIE	Alignment Error Interrupt The ALIE high indicates the length of the incoming frame is not a multiple of byte. If the ALIE is high and EnALIE of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the ALIE status. 1'b0: The frame length is a multiple of byte. 1'b1: The frame length is not a multiple of byte.
[4]	RXGD	Receive Good Interrupt The RXGD high indicates the frame reception has completed. If the RXGD is high and EnRXGD of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RXGD status. 1'b0: The frame reception has not complete yet. 1'b1: The frame reception has completed.
[3]	PTLE	Packet Too Long Interrupt The PTLE high indicates the length of the incoming packet is greater than 1518 bytes and the incoming packet is dropped. If the ALP of MCMDR register is set, the long packet will be regarded as a good packet and PTLE will not be set. If the PTLE is high and EnPTLE of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the PTLE status. 1'b0: The incoming frame is not a long frame or S/W wants to receive a long frame. 1'b1: The incoming frame is a long frame and dropped.

Publication Release Date: Oct 01, 2008

Revision: A2

[2]	RXOV	Receive FIFO Overflow Interrupt The RXOV high indicates the RxFIFO overflow occurred during packet reception. While the RxFIFO overflow occurred, the EMC drops the current receiving packer. If the RxFIFO overflow occurred often, it is recommended that modify RxFIFO threshold control, the RxTHD of FFTCR register, to higher level. If the RXOV is high and EnRXOV of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the RXOV status. 1'b0: No RxFIFO overflow occurred during packet reception. 1'b0: RxFIFO overflow occurred during packet reception.
[1]	CRCE	CRC Error Interrupt The CRCE high indicates the incoming packet incurred the CRC error and the packet is dropped. If the AEP of MCMDR register is set, the CRC error packet will be regarded as a good packet and CRCE will not be set. If the CRCE is high and EnCRCE of MIEN register is enabled, the RxINTR will be high. Write 1 to this bit clears the CRCE status. 1'b0: The frame doesn't incur CRC error. 1'b1: The frame incurred CRC error.
[0]	RXINTR	Receive Interrupt The RXINTR indicates the Rx interrupt status. If RXINTR high and its corresponding enable bit, EnRXINTR of MISTA register, is also high indicates the EMC generates Rx interrupt to CPU. If RXINTR is high but EnRXINTR of MISTA is disabled, no Rx interrupt is generated. The RXINTR is logic OR result of the bits 1~14 in MISTA register do logic AND with the corresponding bits in MIEN register. In other words, if one of the bits 1~14 in MISTA register is high and its corresponding enable bit in MIEN register is also enabled, the RXINTR will be high. Because the RXINTR is a logic OR result, clears bits 1~14 of MISTA register makes RXINTR be cleared, too. 1'b0: No status of bits 1~14 in MISTA is set or no enable of bits 1~14 in MIEN is turned on. 1'b1: At least one status of bits 1~14 in MISTA is set and its corresponding enable bit is turned on.

Publication Release Date: Oct 01, 2008

Revision: A2

MAC General Status Register (MGSTA)

The MGSTA also keeps the statuses of EMC. But the statuses in the MGSTA will not trigger any interrupt. The MGSTA is a write clear register and write 1 to corresponding bit clears the status.

Register	Address	R/W	Description	Reset Value
MGSTA	0xB000_30B4	R/W	MAC General Status Register	0x0000_0000

31	30	29	28	27	26	25	24
			Rese	erved			
23	22	21	20	19	18	17	16
	Reserved						
15	14	13	12	11	10	9	8
Reserved				TXHA	SQE	PAU	DEF
7	6	5	4	3	2	1	0
	CCNT				RFFull	RXHA	CFR

Bits	Description	ns en
[11]	ТХНА	Transmission Halted Default Value: 1'b0 The TXHA high indicates the next normal packet transmission process will be halted because the bit TXON of MCMDR is disabled be S/W. 1'b0: Next normal packet transmission process will go on. 1'b1: Next normal packet transmission process will be halted.
[10]	SQE	Signal Quality Error Default Value: 1'b0 The SQE high indicates the SQE error found at end of packet transmission on 10Mbps half-duplex mode. The SQE error check will only be done while both bit EnSQE of MCMDR is enabled and EMC is operating on 10Mbps half-duplex mode. 1'b0: No SQE error found at end of packet transmission. 1'b0: SQE error found at end of packet transmission.
[9]	PAU	Transmission Paused Default Value: 1'b0 The PAU high indicates the next normal packet transmission process will be paused temporally because EMC received a PAUSE control frame, or S/W set bit SDPZ of MCMDR and make EMC to transmit a PAUSE control frame out. 1'b0: Next normal packet transmission process will go on. 1'b1: Next normal packet transmission process will be paused.
[8]	DEF	Deferred Transmission Default Value: 1'b0 The DEF high indicates the packet transmission has deferred once. The DEF is only available while EMC is operating on half-duplex mode. 1'b0: Packet transmission doesn't defer. 1'b1: Packet transmission has deferred once.

Publication Release Date: Oct 01, 2008

Revision: A2

[7:4]	CCNT	Collision Count Default Value: 4'h0 The CCNT indicates the how many collisions occurred consecutively during a packet transmission. If the packet incurred 16 consecutive collisions during transmission, the CCNT will be 4'h0 and bit TXABT will be set to 1.
[2]	RFFull	RxFIFO Full Default Value: 1'b0 The RFFull indicates the RxFIFO is full due to four 64-byte packets are kept in RxFIFO and the following incoming packet will be dropped. 1'b0: The RxFIFO is not full. 1'b1: The RxFIFO is full and the following incoming packet will be dropped.
[1]	RXHA	Receive Halted Default Value: 1'b0 The RXHA high indicates the next normal packet reception process will be halted because the bit RXON of MCMDR is disabled be S/W. 1'b0: Next normal packet reception process will go on. 1'b1: Next normal packet reception process will be halted.
[0]	CFR	Control Frame Received Default Value: 1'b0 The CFR high indicates EMC receives a flow control frame. The CFR only available while EMC is operating on full duplex mode. 1'b0: The EMC doesn't receive the flow control frame. 1'b1: The EMC receives a flow control frame.

Publication Release Date: Oct 01, 2008

Revision: A2

Missed Packet Count Register (MPCNT)

The MPCNT keeps the number of packets that were dropped due to various types of receive errors. The MPCNT is a read clear register. In addition, S/W also can write an initial value to MPCNT and the missed packet counter will start counting from that initial value. If the missed packet counter is overflow, the MMP of MISTA will be set.

Register	Address	R/W	Description	Reset Value
MPCNT	0xB000_30B8	R/W	Missed Packet Count Register	0x0000_7FFF

	MPC							

Bits	Descriptions	
[15:0]	мрс	Miss Packet Count Default Value: 16'h7FFF The MPC indicates the number of packets that were dropped due to various types of receive errors. The following type of receiving error makes missed packet counter increase: Incoming packet is incurred RxFIFO overflow. Incoming packet is dropped due to RXON is disabled. Incoming packet is incurred CRC error.

Publication Release Date: Oct 01, 2008

Revision: A2

MAC Receive Pause Count Register (MRPC)

The EMC of W90P950 supports the PAUSE control frame reception and recognition. If EMC received a PAUSE control frame, the operand field of the PAUSE control frame will be extracted and stored in the MRPC register. The MRPC register will keep the same while Tx of EMC is pausing due to the PAUSE control frame is received. The MRPC is read only and write to this register has no effect.

Re	egister	Address	R/W	Description	Reset Value
N	MRPC	0xB000_30BC	R	MAC Receive Pause Count Register	0x0000_0000

31	30	29	28	27	26	25	24

15	14	13	12	11	10	9	8	
	MRPC							
7	6	5	4	3	2	1	0	
	MRPC							

Bits	Descriptions	
[15:0]	MRPC	MAC Receive Pause Count Default Value: 16'h0 The MRPC keeps the operand field of the PAUSE control frame. It indicates how many slot time (512 bit time) the Tx of EMC will be paused.

Publication Release Date: Oct 01, 2008

Revision: A2

MAC Receive Pause Current Count Register (MRPCC)

The EMC of W90P950 supports the PAUSE control frame reception and recognition. If EMC received a PAUSE control frame, the operand field of the PAUSE control frame will be extracted and stored into a down count timer. The MRPCC shows the current value of that down count timer for S/W to know how long the Tx of EMC will be paused. The MRPCC is read only and write to this register has no effect.

Register	Address	R/W	Description	Reset Value
MRPCC	0xB000_30C0	R	MAC Receive Pause Current Count Register	0x0000_0000

31	30	29	28	27	26	25	24	
	Reserved

15	14	13	12	11	10	9	8	
	MRPCC							
7	6	5	4	3	2	1	0	
	MRPCC							

Bits	Descriptions	
[15:0]	MRPCC	MAC Receive Pause Current Count Default Value: 16'h0 The MRPCC shows the current value of that down count timer. If a new PAUSE control frame is received before the timer count down to zero, the new operand of the PAUSE control frame will be stored into the down count timer and the timer starts count down from the new value.

Publication Release Date: Oct 01, 2008

Revision: A2

MAC Remote Pause Count Register (MREPC)

The EMC of W90P950 supports the PAUSE control frame transmission. After the PAUSE control frame is transmitted out completely, a timer starts to count down from the value of operand of the transmitted PAUSE control frame. The MREPC shows the current value of this down count timer. The MREPC is read only and write to this register has no effect.

Register	Address	R/W	Description	Reset Value
MREPC	0xB000_30C4	R	MAC Remote Pause Count Register	0x0000_0000

31	30	29	28	27	26	25	24	
	Reserved							
23	22	21	20	19	18	17	16	
	Reserved							
15	14	13	12	11	10	9	8	
	MREPC							
7	6	5	4	3	2	1	0	
	MREPC							

Bits	Descriptions	
[15:0]	MREPC	MAC Remote Pause Count Default Value: 16'h0 The MREPC shows the current value of the down count timer that starts to count down from the value of operand of the transmitted PAUSE control frame.

Publication Release Date: Oct 01, 2008

Revision: A2

DMA Receive Frame Status Register (DMARFS)

The DMARFS is used to keep the Length/Type field of each incoming Ethernet packet. This register is write-clear and writes 1 to corresponding bit clears the bit.

Register	Address	R/W	Description	Reset Value
DMARFS	0xB000_30C8	R/W	DMA Receive Frame Status Register	0x0000_0000

31	30	29	28	27	26	25	24	
	Reserved							
23	22	21	20	19	18	17	16	
	Reserved							
15	14	13	12	11	10	9	8	
	RXFLT							
7	6	5	4	3	2	1	0	
	RXFLT							

Bits	Descriptions	
[15:0]	RXFLT	Receive Frame Length/Type Default Value: 16'h0 The RXFLT keeps the Length/Type field of each incoming Ethernet packet. If the bit EnDEN of MIEN is enabled and the Length/Type field of incoming packet has received, the bit DENI of MISTA will be set and trigger interrupt. And, the content of Length/Type field will be stored in RXFLT.

Publication Release Date: Oct 01, 2008

Publication Release Date: Oct 01, 2008

Revision: A2

7.5.4 Operation Notes

MII Management Interface

The operation mode between EMC and external PHY must be identically. Consequently, S/W has to access control register of external PHY through MII management interface to get operation information of PHY. To issue MII management command to access external PHY, the MIID and MIIDA registers can be used. And, while using MII management interface, the EnMDC of MCMDR register must be set to high.

EMC Initial

If S/W wants to enable EMC for packet transmission and reception, the TXON and RXON of MCMDR register must be enabled. But, before enabling TXON and RXON, the following issues must be noted.

For packet transmission, the Tx descriptor link list and Tx frame buffer must be prepared and TXDLSA must be configured.

For incoming packet destination MAC address recognition, the CAMCMR, CAMEN, CAMXM and CAMXL registers must be configured. For incoming packet's buffering, the Rx descriptor link list and Rx frame buffer must be prepared and RXDLSA register must be configured.

Besides, the interrupt status that S/W wants to know must be enabled through MIEN register.

Finally, the EMC operation mode control bits of MCMDR must be configured and TXON and RXON must be enabled.

MAC Interrupt Status Register (MISTA)

The MISTA register keeps the status of EMC operation. It is recommended that S/W must enable four interrupt statuses at least. They are TxBErr, RxBErr, TDU and RDU.

While EMC accesses memory, it reports the memory error through TxBErr or TxBErr status. If any of them actives, the reset EMC is recommended.

For packet transmission, a valid Tx descriptor is required, and for packet reception, a valid Rx one is. If EMC cannot find a valid Tx or Rx descriptor, it sets TDU or RDU to high respectively. After S/W releases a valid Tx or Rx descriptor to EMC, writing TSDR or RSDR register to enable packet transmission and reception again is needed.

Pause Control Frame Transmission

The EMC supports the PAUSE control frame transmission for flow control while EMC is operating on full-duplex mode. The register CAM13M, CAM13L, CAM14M, CAM14L, CAM15M and CAM15L are designed for this purpose.

For PAUSE control frame transmission, first, S/W must configure destination MAC address of control frame into the register pair {CAM13M, CAM13L}, source MAC address into the register pair {CAM14M, CAM14L}, and configure length/type, op-code and operand of control frame into the register pair {CAM15M, CAM15L}. The bit CAM13EN, CAM14EN and CAM15EN of CAMEN register are also needed be enabled. Then, set bit SDPZ of MCMDR register to high to enable PAUSE control frame transmission. After the PAUSE control frame transmission completed, the SDPZ will be cleared automatically.

Internal Loop-back

If the LBK of MCMDR register is set, the EMC operates on internal loop-back mode. While EMC operates on internal loop-back mode, it also means EMC operates on full-duplex mode, and the value of FDUP of MCMDR register is ignored.

Publication Release Date: Oct 01, 2008

Revision: A2

7.6 GDMA Controller

7.6.1 Overview & Features

The chip has a two-channel general DMA controller with or without descriptor fetch operation, called the GDMA. The two-channel GDMA performs the following data transfers without the CPU intervention:

- Memory-to-memory (memory to/from memory)
- Memory -to IO
- IO- to -memory

The on-chip GDMA can be started by the software. Software can also be used to restart the GDMA operation after it has been stopped. The CPU can recognize the completion of a GDMA operation by software polling or when it receives an internal GDMA interrupt. The GDMA controller can increment source or destination address, decrement them as well, and conduct 8-bit (byte), 16-bit (half-word), or 32-bit (word) data transfers.

7.6.2 GDMA Non-Descriptor Functional Description

The GDMA directly transfers data between source and destination. The GDMA starts to transfer data after it receives service requests from software. When the entire data have been transferred completely, the GDMA becomes idle. Nevertheless, if another transfer is needed, then the GDMA must be programmed again.

7.6.3 GDMA Descriptor Functional Description

The descriptor-fetch function works when run-bit (bit-3) is set and non-dsptrmode-bit (bit-2) is cleared in Descriptor Register (GDMA_DADRx) and the GDMA_CTLx bit setting as following table. The Non-descriptor-fetch function works when software triggers the [softreq] bit (bit-16) and the [gdmaen] bit (bit-0) in GDMA_CTLx Register. If the [softreq] set to zero and the [GDMAMS] (bit2-3) set as 01 or 10 will start the I/O to memory function. Software can also be used to restart the GDMA operation after it has been stopped. The CPU can recognize the completion of a GDMA operation by software polling or when it receives an internal GDMA interrupt. The GDMA controller can increase source or destination address, decrease them as well, and conduct 8-bit (byte), 16-bit (half-word), or 32-bit (word) data transfers.

Operation Mode	Enable bit
Non-Descriptor Mode with SW Enable	GDMA_CTLx: gdmaen[0] softreq[16] gdmams[3:2]
Non-Descriptor Mode with I/O Enable	GDMA_CTLx : gdmaen[0] gdmams[3:2]
Descriptor Mode with SW Enable	GDMA_DADRx : run[3] non-dsptrmode[2];
	GDMA_CTLx in Descriptor List: gdmaen[0] gdmams[3:2]
Descriptor Mode with I/O Enable	GDMA_DADRx : run[3] non-dsptrmode[2];
	GDMA_CTLx in Descriptor List: gdmaen[0] gdmams[3:2]

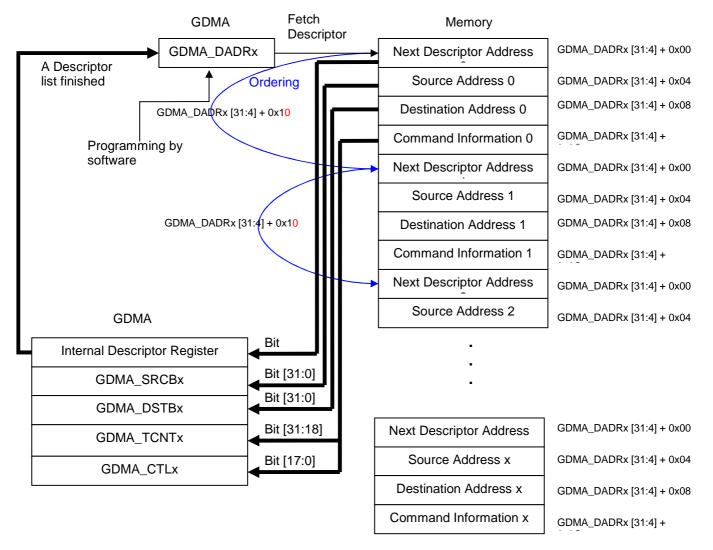

Publication Release Date: Oct 01, 2008

7.6.3.1 Descriptor Fetch Function

The Illustration of Descriptor list fetches:

Single Channel Descriptor

Publication Release Date: Oct 01, 2008

Revision: A2

Descriptor-based function (GDMA_DADRx [NON_DSPTRMODE] = 0) operate in the following condition:

Memory to Memory

- 1. Software can write a value 0x04 to current GDMA_DADRx register to reset the register and disable Descriptor based function first.
- 2. Then software can program the bits of [Descriptor Address], [RUN], [NON_DSPTRMODE] and [ORDEN] to the GDMA_DADRx register to enable Descriptor based function. (The Descriptor can only work when the [RUN] [3] is set and [NON_DSPTRMODE] [2] bit is cleared properly.)
- 3. After sets current GDMA_DADRx register, the GDMA will fetch four-word information from memory immediately which contains the next Descriptor address, Source Address, Destination Address and Command information. (Command information consists of control and counter registers)

NOTE: GDMA will read the descriptor list from memory such the diagram above and write back to GDMA internal register (next GDMA_DADRx), GDMA_SRCBx, GDMA_DSTBx, GDMA_CTLx and GDMA_TCNTx registers. The most important one of write back is command information, which will separate some bits of command information into control and counter registers respectively. The first fourteen bits of the MSB of the Command information in Descriptor list will be written back to GDMA_TCNTx register, and the others bits of the Command information will be written back to GDMA_CTLx register. The control register part of the Command information will update the GDMA_CTLx register during every descriptor fetch. The allocation of command information is described at GDMA Register Descriptions.

The Allocation of Command Information in Descriptor List:

31	30	29	28	27	26	25	24		
	GDMA_TCNTx[13:6] ← Command Info[31:24]								
23	22	21	20	19	18	17	16		
	GDMA_TCNTx[5:0] ← Command Info[23:18]								
15	14	13	12	11	10	9	8		
TV	TWS		VED	D_INTS	D_INTS	RESE	RVED		
7	6	5	5 4		2	1 0			
SAFIX	DAFIX	SADIR	DADIR	GDMAMS		ВМЕ	GDMAEN		

- 4. GDMA will depend on the information to request a bus ownership and start the data transfer when GDMA has gotten a bus grant from the arbiter, otherwise, it will wait until get bus grant. The data transfer direction is dependent on the Control register.
- 5. The GDMA transfers data and releases bus at every burst transfer. The GDMA will stop transfer for current descriptor when the counter is decreased to zero. The current GDMA_DADRx will be updated by next GDMA_DADRx at end of each descriptor transfer.
- 6. The GDMA is running consecutively unless the next GDMA_DADRx[RUN] bit is zero or interrupt status bit of GDMA_INTCS register is cleared. The CPU can recognize the completion of a GDMA descriptor fetch operation by polling the current GDMA_DADRx[NON_DSPTRMODE] bit or set the GDMA_CTLx[D_INTS] to receive a interrupt from GDMA.(Note: The recommendation is the [NON_DSPTRMODE] bit in list is set at the same time)
- 7. When an error occurs in the descriptor operation, GDMA will clear [RUN] bit and stop channel operation immediately. Software can reset the channel, and sets the current GDMA_DADRx [RUN] register to start again.

147

Publication Release Date: Oct 01, 2008

Revision: A2

Memory to I/O and I/O to Memory

- 1. Software must set the [REQ_ATV], [ACK_ATV] and [GDMAMS] bits in GDMA_CTLx register corresponding to I/O pin with pull high or pull low properly first, and then set the current GDMA_DADRx to start the I/O to Memory with descriptor fetch transfer.
- 2. The descriptor lists stop transfer until the RUN bit was zero in descriptor list when external I/O request triggered once. The RUN bit can be set when external I/O request triggered again under the NON_DSPTRMODE bit was zero in descriptor list. The trigger period of the external I/O has a timing limitation whatever the GDMA was in single or burst mode, and the periodic trigger of the external I/O must be less than 38 MCLK.
- 3. Each GDMA lists can operate after clearing interrupt status. The descriptor lists stop transfer until the RUN bit was zero or interrupt status was set.
- 4. The next Descriptor address, Source Address, Destination Address and Command information must be set properly in every Descriptor list. Especially, every bit of the Command information will update the GDMA_CTLx and GDMA_TCNTx registers at every initiation of descriptor list.

NOTE: The [BLOCK] bit of GDMA_CTLx register is disabled when the descriptor mode of the I/O to memory is enabled.

NOTE: GDMA can change mode with following description:

Descriptor-fetch of each channel can be stopped until the current transfer list done. Software can change Descriptor mode to Non-Descriptor mode by writing 0x04 to GDMA_DADRx register during the current descriptor transfer operating.

Non-Descriptor fetch can be stopped until current transfer count finished when software programs the GDMA_CTLx register with gdmaen bit cleared or softreq cleared.

NOTE: Once software programs the current GDMA_DADRx register, GDMA will fetch the descriptor list from memory and fill the data to next GDMA_DADRx, current GDMA_SRCBx, current GDMA_DSTBx, current GDMA_CTLx and current GDMA_TCNTx registers automatically. The fourth word in descriptor list includes the information for GDMA_CTLx and GDMA_TCNTx registers.

NOTE: The descriptor fetch function only occurs when current GDMA_DADRx [RUN] bit is set and GDMA_DADRx [NON_DSPTRMODE] is cleared. The current GDMA_DADRx will be updated by next GDMA_DADRx at every descriptor stops.

7.6.3.2 Ordering function in Descriptor fetch mode

This function determines the source of next descriptor address. If [ORDEN] is set, the GDMA controller fetches the next descriptor from current GDMA_DADRx [Descriptor Address] + 16 bytes.

If this bit is cleared, GDMA fetches the next descriptor from the current GDMA_DADRx [Descriptor Address].

GDMA_DADRx [ORDEN] is only relevant to descriptor-fetch function (GDMA_DADRx [NON_DSPTRMODE] = 0).

148

Publication Release Date: Oct 01, 2008

Revision: A2

7.6.3.3 Channel Reset

The Channel reset is turned on when the bit-0 of GDMA_DADRx is set. This function will clear all status and stop the descriptor based function relative to individual channel. The GDMA_DADRx register value is 0x05h when reset bit is set.

7.6.3.4 Non-Descriptor Fetch Function

The non-descriptor-fetch function will take place when current GDMA_DADRx [NON_DSPTRMODE] is set and the GDMA_DADRx register will have no any intention for the GDMA controller.

The default value of GDMA_DADRx is 0x04. Software can clear GDMA_DADRx with value 0x04 as well. In this mode, software should write a valid source address to the GDMA_SRCBx register, a destination address to the GDMA_DSTBx register, and a transfer count to the GDMA_TCNTx register. Next, the GDMA_CTLx of [gdmaen] and [softreq] bits must be set. A non-descriptor fetch is performed when bus granted. After transferring a number of bytes or words correspond with burst mode or not, the channel either waits for the next request or continues with the data transfer until the GDMA_CTCNTx reaches zero. When GDMA_CTCNTx reaches zero, the channel stops operation.

When an error occurs during the GDMA operation, the channel stops unless software clears the error condition and sets the GDMA_CTLx of [gdmaen] and [softreq] bits field to start again.

7.6.4 GDMA Register Map

R: read only, W: write only, R/W: both read and write, C: Only value 0 can be written

SAFIX	DAFIX	SADIR DADIR		GDM	AMS	ВМЕ	GDMAEN

2. Descriptor fetches Mode

31	30	29	28	27	26	25	24
	RESERVED						RESERVED
23	22	21	20	19	18	17	16
RESERVED	SABNDERR	DABNDERR		RESERVED			SOFTREQ
15	14	13	12	11	10	9	8
RESE	RESERVED		S	RESERVED	D_INTS	RESE	RVED
7	6	5	4	3	2	1	0
SAFIX	DAFIX	SADIR	DADIR	GDMAMS		ВМЕ	GDMAEN

NOTE:

- □ The bit [REQ_ATV] and [ACK_ATV] must be set first before using I/O to Memory mode with Descriptor fetch transfer. These two bits cannot do any setup in command information within descriptor list configuration. The [SABNDERR], [DABNDERR], [GDMAERR] can also be read at descriptor fetch mode.
- □ Regardless of GDMA operate in descriptor mode or non-descriptor mode, when transfer width is 16-bit (half word) and the address with decrement function enable for starting source address or destination address or both are used should set the least two bit of addresses is 0xF.

Publication Release Date: Oct 01, 2008

Revision: A2

Control Register of Non-Descriptor fetches Mode:

Bits	Descriptions	
[22]	SABNDERR	Source Address Boundary Alignment Error Flag If TWS [13:12]=10, GDMA_SRCB [1:0] should be 00 If TWS [13:12]=01, GDMA_SRCB [0] should be 0 Except the SADIR function enabled. The address boundary alignment should be depended on TWS [13:12]. 0 = the GDMA_SRCB is on the boundary alignment. 1 = the GDMA_SRCB not on the boundary alignment The SABNDERR register bits just can be read only.
[21]	DABNDERR	Destination Address Boundary Alignment Error Flag If TWS [13:12]=10, GDMA_DSTB [1:0] should be 00 If TWS [13:12]=01, GDMA_DSTB [0] should be 0 Except the SADIR function enabled. The address boundary alignment should be depended on TWS [13:12]. 0 = the GDMA_DSTB is on the boundary alignment. 1 = the GDMA_DSTB not on the boundary alignment The DABNDERR register bits just can be read only.
[19]	AUTOIEN	Auto initialization Enable 0 = Disables auto initialization 1 = Enables auto initialization, the GDMA_CSRCO/1, GDMA_CDSTO/1, and GDMA_CTCNTO/1 registers are updated by the GDMA_SRCO/1, GDMA_DSTO/1, and GDMA_TCNTO/1 registers automatically when transfer is complete. GDMA will start another transfer when SOFTREQ set again.
[17]	вьоск	Bus Lock 0 = Unlocks the bus during the period of transfer 1 = locks the bus during the period of transfer
[16]	SOFTREQ	Software Triggered GDMA Request Software can request the GDMA transfer service by setting this bit to 1. This bit is automatically cleared by hardware when the transfer is completed. This bit is available only while GDMAMS [3:2] register bits are set on software mode (memory to memory and memory to I/O).
[13:12]	TWS	Transfer Width Select 00 = One byte (8 bits) is transferred for every GDMA operation 01 = One half-word (16 bits) is transferred for every GDMA operation 10 = One word (32 bits) is transferred for every GDMA operation 11 = Reserved The GDMA_SCRB and GDMA_DSTB should be alignment under the TWS selection

Publication Release Date: Oct 01, 2008

Revision: A2

[7]	SAFIX	Source Address Fixed 0 = Source address is changed during the GDMA operation 1 = Do not change the destination address during the GDMA operation. This feature can be used when data were transferred from a single source to multiple destinations.
[6]	DAFIX	Destination Address Fixed 0 = Destination address is changed during the GDMA operation 1 = Do not change the destination address during the GDMA operation. This feature can be used when data were transferred from multiple sources to a single destination.
[5]	DADIR	Source Address Direction 0 = Source address is incremented successively 1 = Source address is decremented successively
[4]	DADIR	Destination Address Direction 0 = Destination address is incremented successively 1 = Destination address is decremented successively
[3:2]	GDMAMS	GDMA Mode Select 00 = Software mode 01 = Reserved 10 = Reserved 11 = Reserved
[1]	вме	Burst Mode Enable 0 = Disables the 8-data burst mode 1 = Enables the 8-data burst mode If there are 8 words to be transferred, and the BME [1] =1, the GDMA_TCNTx should be 0x01. However, if BME [1] =0, the GDMA_TCNTx should be 0x08. It has to set BME [1] = 0 for I/O device access.
[0]	GDMAEN	GDMA Enable 0 = Disables the GDMA operation 1 = Enables the GDMA operation; this bit will be clear automatically when the transfer is complete on AUTOIEN [19] register bit is on Disable mode. Note: When operate in Non-Descriptor mode, this bit determines the Memory-to Memory, Memory-to-I/O and I/O-to-Memory operation or not. When operate in Descriptor mode, this bit is determined in descriptor list. Note: Channel reset will clear this bit.

Publication Release Date: Oct 01, 2008

		Cl	JRRENT_TF	R_CNT [7:	0]					

Bits	Descriptions	
[23:0]	CURRENT_TFR_CNT	Current Transfer Count The Current transfer count register indicates the number of transfer being performed. Non-Descriptor Mode: 24-bit CURENT_TFR_CNT [23:0] Descriptor Mode : 14-bit CURENT_TFR_CNT [13:0]

Publication Release Date: Oct 01, 2008

Revision: A2

Channel 0/1 Descriptor Register (GDMA_DADR0/1)

	Address	R/W	Description	Reset Value
GDMA_DADR0	0xB000_401C	R/W	Channel 0 Control Register	0x0000_0004
GDMA_DADR1	0xB000_403C	R/W	Channel 1 Control Register	0x0000_0004

31	30	29	28	27	26	25	24		
	Descriptor Address[31:24]								
23	22	21	20	19	18	17	16		
	Descriptor Address[23:16]								
15	14	13	12	11	10	9	8		
	Descriptor Address[15:8]								
7	7 6 5 4 3 2 1 0								
C	Descriptor Address[7:4]				NON_DSPTRMODE	ORDEN	RESET		

Bits	Descriptions	
[31:4]	Descriptor Address	Descriptor Address Contains address of next descriptor.
[3]	RUN	Run The RUN bit can be cleared during descriptor data transfer, and set RUN bit to starts the stopped channel under [Descriptor Address] and [Non-DSPTRMODE] bits are set properly. When RUN bit is cleared and the NON_DSPTRMODE bit is set that non-descriptor fetch occurs whether a valid descriptor address is written to register GDMA_DADRx or not. This bit will reset automatically when each descriptor transfer stopped or the bit in descriptor list is zero. The Descriptor interrupt is determined by bit-10 of the GDMA_CTLx Register. 0 = Stops the channel. 1 = Starts the channel. Note: must co-operate to [NON_DSPTRMODE] to start the channel with Descriptor fetch function.

Publication Release Date: Oct 01, 2008

Revision: A2

[2]	NON_DSPTRMODE	Non-Descriptor-Fetch When NON_DSPTRMODE is set, the channel is considered as a channel with no descriptors. In this mode, the GDMA does not initiate descriptor fetching and software can program the SCRBx, DSTBx, CTRx and TCNTx registers to transfer data until the TCNTx reaches zero. The GDMA_DADRx register is not used in non-descriptor mode. If NON_DSPTRMDOE is cleared under [RUN] and [Descriptor Address] are set properly, GDMA controller initiates descriptor-fetching. The descriptor fetch transfer stops when the counter for the current transfer reaches zero, [RUN] bit is cleared and [NON_DSPTRMODE] is set base on the bits of the descriptor list. 0 = Descriptor-fetch transfer 1 = NON-descriptor-fetch transfer Note: this bit = 1 will disable Descriptor function regardless of the RUN bit is 1 or not.
[1]	ORDEN	Enable Ordering Execution for Descriptor List The GDMA_DADRx [ORDEN] determine which the next descriptor address will be fetched. If [ORDEN] is set, the GDMA controller fetches the next descriptor from Current GDMA_DADRx [Descriptor Address] + 16 bytes. If this bit is cleared, GDMA fetches the next descriptor address from the current GDMA_DADRx [Descriptor Address] register. GDMA_DADRx [ORDEN] is relevant only for descriptor-fetch function (GDMA_DADRx [NON_DSPTRMODE] = 0). 0 = Disable descriptor ordering. Fetch the next descriptor from register GDMA_DDADRx [Descriptor Address]. 1 = Enable descriptor ordering.
[0]	RESET	Reset Channel 0 = Disable channel reset. 1 = Enable channel status reset and disable descriptor based function.

Publication Release Date: Oct 01, 2008

Revision: A2

Channel 0/1 GDMA Internal Buffer Register (GDMA_INTBUF0/1)

Software can set the [17-16] bit of GDMA_INTCS to select channels and watch the value which has read from memory.

Register	Register Address		Description	Reset Value
GDMA_INTBUF0	0xB000_4080	R	GDMA Internal Buffer Word 0	0x0000_0000
GDMA_INTBUF1	0xB000_4084	R	GDMA Internal Buffer Word 1	0x0000_0000
GDMA_INTBUF2	0xB000_4088	R	GDMA Internal Buffer Word 2	0x0000_0000
GDMA_INTBUF3	0xB000_408C	R	GDMA Internal Buffer Word 3	0x0000_0000

7.7 USB Host Controller (USBH)

The **Universal Serial Bus (USB)** is a fast, bi-directional, isochronous, low-cost, dynamically attachable serial interface standard intended for USB devices. The USB is a 4-wire serial cable bus that supports serial data exchange between a Host Controller and a network of peripheral devices. The attached peripherals share USB bandwidth through a host-scheduled, token-based protocol. Peripherals may be attached, configured, used, and detached, while the host and other peripherals continue operation (i.e. hot plug and unplug is supported).

A major design goal of the USB standard was to allow flexible, plug-and-play networks of USB devices. In any USB network, there will be only one host, but there can be many devices and hubs.

The USB Host Controller includes the following features

- Fully compliant with USB Revision 2.0 specification.
- Enhanced Host Controller Interface (EHCI) Revision 1.0 compatible.
- Open Host Controller Interface (OHCI) Revision 1.0 compatible.
- Supports high-speed (480Mbps), full-speed (12Mbps) and low-speed (1.5Mbps) USB devices.
- Supports Control, Bulk, Interrupt, Isochronous and Split transfers.
- Integrated a port routing logic to route full/low speed device to OHCI controller.
- Built-in DMA for real-time data transfer.

7	6	5	4	3	2	1	0	
	CR_Length							

Bits	Descriptions	
[31:16]	Version	Host Controller Interface Version Number This is a two-byte register containing a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision.
[7:0]	CR_Length	Capability Registers Length This register is used as an offset to add to register base to find the beginning of the Operational Register Space.

Publication Release Date: Oct 01, 2008

Revision: A2

EHCI Structural Parameters Register (EHCSPR)

Register	Address	R/W	Description	Reset Value
EHCSPR	0xB000_5004	R	EHCI Structural Parameters Register	0x0000_0012

31	30	29	28	27	26	25	24			
	Reserved									
23	22	21	20	19	18	17	16			
	Reserved									
15	14	13	12	11	10	9	8			
	N_CC				N_PCC					
7	6	5	4	3	2	1	0			
	Reserved PPC				N_P	ORTS				

Bits	Descriptio	ns
[15:12]	N_CC	Number of Companion Controller This field indicates the number of companion controllers associated with this USB 2.0 host controller. A zero in this field indicates there are no companion host controllers. Portownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports. A value larger than zero in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports.
[11:8]	N_PCC	Number of Ports per Companion Controller This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software. For example, if N_PORTS has a value of 6 and N_CC has a value of 2 then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller 1, the next N_PCC ports to companion controller 2, etc. In the previous example, the N_PCC could have been 4, where the first 4 are routed to companion controller 1 and the last two are routed to companion controller 2. The number in this field must be consistent with N_PORTS and N_CC.
[4]	PPC	Port Power Control This field indicates whether the host controller implementation includes port power control. A one in this bit indicates the ports have port power switches. A zero in this bit indicates the port do not have port power stitches. The value of this field affects the functionality of the <i>Port Power</i> field in each port status and control register.
[3:0]	N_PORTS	Number of Physical Downstream Ports This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1H to FH. A zero in this field is undefined.

Publication Release Date: Oct 01, 2008

Revision: A2

EHCI Capability Parameters Register (EHCCPR)

Register	Address	R/W	Description	Reset Value

Bits	Descriptions	
[15:8]	EECP	EHCI Extended Capabilities Pointer (EECP) 8'h0: No extended capabilities are implemented.
[7:4]	ISO_SCH_TH	Isochronous Scheduling Threshold
[2]	ASPC	Asynchronous Schedule Park Capability 1'b0: This EHCI host controller doesn't support park feature of high-speed queue heads in the Asynchronous Schedule.
[1]	PFList	Programmable Frame List Flag 1'b0: System software must use a frame list length of 1024 elements with this EHCI host controller.
[0]	64B	64-bit Addressing Capability 1'b0: Data structure using 32-bit address memory pointers.

Publication Release Date: Oct 01, 2008

Revision: A2

USB Command Register (UCMDR)

Register	Address	R/W	Description	Reset Value
UCMDR	0xB000_5020	R/W	USB Command Register	0x0008_0000

31	30	29	28	27	26	25	24			
	Reserved									
23	22	21	20	19	18	17	16			
	INT_TH_CTL									
15	14	13	12	11	10	9	8			
	Reserved									
7	6	5	4	3	2	1	0			
Reserved	AsynADB	ASEN	PSEN	FLSize		HCRESET	RunStop			

Bits	Descriptions	
[23:16]	INT_TH_CTL	Interrupt Threshold Control (R/W) This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined. Value Maximum Interrupt Interval 00h Reserved 01h 1 micro-frame 02h 2 micro-frames 04h 4 micro-frames 08h 8 micro-frames (default, equates to 1 ms) 10h 16 micro-frames (2 ms) 20h 32 micro-frames (4 ms) 40h 64 micro-frames (8 ms) Any other value in this register yields undefined results. Software modifications to this bit while HCHalted bit is equal to zero results in undefined behavior.
[6]	AsynADB	Interrupt on Async Advance Doorbell (R/W) This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the USBSTS register. If the Interrupt on Async Advance Enable bit in the USBINTR register is a one then the host controller will assert an interrupt at the next interrupt threshold. The host controller sets this bit to a zero after it has set the Interrupt on Async Advance status bit in the USBSTS register to a one. Software should not write a one to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.

Publication Release Date: Oct 01, 2008

Revision: A2

[5]	ASEN	Asynchronous Schedule Enable (R/W) This bit controls whether the host controller skips processing the Asynchronous Schedule. Values mean: 0b Do not process the Asynchronous Schedule 1b Use the ASYNCLISTADDR register to access the Asynchronous Schedule
[4]	PSEN	Periodic Schedule Enable (R/W) This bit controls whether the host controller skips processing the Periodic Schedule. Values mean: 0b Do not process the Periodic Schedule 1b Use the PERIODICLISTBASE register to access the Periodic Schedule
[3:2]	FLSize	Frame List Size (R/W or RO) This field is R/W only if Programmable Frame List Flag in the HCCPARAMS registers is set to a one. This field specifies the size of the frame list. The size the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index. Values mean: 00b 1024 elements (4096 bytes) Default value 01b 512 elements (2048 bytes) 10b 256 elements (1024 bytes) – for resource-constrained environment 11b Reserved
[1]	HCRESET	Host Controller Reset (HCRESET) (R/W) This control bit is used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset. When software writes a one to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports. All operational registers, including port registers and port state machines are set to their initial values. Port ownership reverts to the companion host controller(s), with the side effects. Software must reinitialize the host controller in order to return the host controller to an operational state. This bit is set to zero by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a zero to this register. Software should not set this bit to a one when the HCHalted bit in the USBSTS register is a zero. Attempting to reset an actively running host controller will result in undefined behavior.
[0]	RunStop	Run/Stop (R/W) 1=Run. 0=Stop. When set to a 1, the Host Controller proceeds with execution of the schedule. The Host Controller continues execution as long as this bit is set to a 1. When this bit is set to 0, the Host Controller completes the current and any actively pipelined transactions on the USB and then halts. The Host Controller must halt within 16 micro-frames after software clears the Run bit. The HC Halted bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software must not write a one to this field unless the host controller is in the Halted state (i.e. HCHalted in the USBSTS register is a one). Doing so will yield undefined results.

Publication Release Date: Oct 01, 2008

Revision: A2

USB Status Register (USTSR)

23	22	21	20	19	18	17	16			
	Reserved									
15	14	13	12	11	10	9	8			
ASSTS	PSSTS	RECLA	HCHalted	Reserved						
7	6	5	4	3	2	1	0			
Rese	rved	IntAsynA	HSERR	FLROVER PORTCHG UERRINT USB			USBINT			

Bits	Descriptions	
[15]	ASSTS	Asynchronous Schedule Status (RO) The bit reports the current real status of the Asynchronous Schedule. If this bit is a zero then the status of them Asynchronous Schedule is disabled. If this bit is a one then the status of the Asynchronous Schedule is enabled. The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either r enabled (1) or disabled (0).
[14]	PSSTS	Periodic Schedule Status (RO) The bit reports the current real status of the Periodic Schedule. If this bit is a zero then the status of the Periodic Schedule is disabled. If this bit is a one then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled (1) or disabled (0).
[13]	RECLA	Reclamation (RO) This is a read-only status bit, which is used to detect an empty asynchronous schedule.
[12]	HCHalted	HCHalted (RO) This bit is a zero whenever the Run/Stop bit is a one. The Host Controller sets this bit to one after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (e.g. internal error).

Publication Release Date: Oct 01, 2008

Revision: A2

[5]	IntAsynA	Interrupt on Async Advance (R/WC) System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing a one to the Interrupt on Async Advance Doorbell bit in the USBCMD register. This status bit indicates the assertion of that interrupt source.
[4]	HSERR	Host System Error (R/WC) The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module.
[3]	FLROVER	Frame List Rollover (R/WC) The Host Controller sets this bit to a one when the Frame List Index rolls over from its maximum value to zero. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the Frame List Size field of the USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX [13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to a one every time FRINDEX [12] toggles.
[2]	PortCHG	Port Change Detect (R/WC) The Host Controller sets this bit to a one when any port for which the Port Owner bit is set to zero has a change bit transition from a zero to a one or a Force Port Resume bit transition from a zero to a one as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to a one after system software has relinquished ownership of a connected port by writing a one to a port's Port Owner bit. This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force port resume, over-current change, enable/disable change and connect status change).
[1]	UERRINT	USB Error Interrupt (USBERRINT) (R/WC) The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (e.g., error counter underflow). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and USBINT bit are set.
[0]	USBINT	USB Interrupt (USBINT) (R/WC) The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set. The Host Controller also sets this bit to 1 when a short packet is detected (actual number of bytes received was less than the expected number of bytes).

	FrameIND									

Bits	Descriptions	
[13:0]	FrameIND	Frame Index The value in this register increment at the end of each time frame (e.g. micro-frame). Bits [N: 3] are used for the Frame List current index. This means that each location of the frame list is accessed 8 times (frames or micro-frames) before moving to the next index. The following illustrates values of N based on the value of the Frame List Size field in the USBCMD register.

ASTMR										

Bits	Descriptions	
[11:0]	ASSTMR	Asynchronous Schedule Sleep Timer This field defines the AsyncSchedSleepTime of EHCI spec. The asynchronous schedule sleep timer is used to control how often the host controller fetches asynchronous schedule list from system memory while the asynchronous schedule is empty. The default value of this timer is 12'hBD6. Because this timer is implemented in UTMI clock (30MHz) domain, the default sleeping time will be about 100us.

7	6	5	4	3	2	1	0
Suspend	FPResum	OCCHG	OCACT	PENCHG	PEN	CSCHG	CSTS

Bits	Descriptions			
[13]	PO	Port Owner (R/W) This bit unconditionally goes to a 0b when the Configured bit in the CONFIGFLAG register makes a 0b to 1b transition. This bit unconditionally goes to 1b whenever the Configured bit is zero. System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes a one to this bit when the attached device is not a high-speed device. A one in this bit means that a companion host controller owns and controls the port.		
[12]	PP	Port Power (PP) Host controller has port power control switches. This bit represents the Current setting of the switch $(0 = off, 1 = on)$. When power is not available on a port (i.e. PP equals a 0), the port is nonfunctional and will not report attaches, detaches, etc. When an over-current condition is detected on a powered port and PPC is a one, the PP bit in each affected port may be transitioned by the host controller from a 1 to 0 (removing power from the port).		
[11:10]	LStatus	Line Status (RO) These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is zero and the current connect status bit is set to a one. The encoding of the bits are: Bits[11:10] USB State Interpretation 00b SE0 Not Low-speed device, perform EHCI reset 10b J-state Not Low-speed device, perform EHCI reset 01b K-state Low-speed device, release ownership of port 11b Undefined Not Low-speed device, perform EHCI reset. This value of this field is undefined if Port Power is zero.		

Publication Release Date: Oct 01, 2008

Revision: A2

[8]	PRST	Port Reset (R/W) 1=Port is in Reset. 0=Port is not in Reset. Default = 0. When software writes a one to this bit (from a zero), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a zero to this bit to terminate the bus reset sequence. Software must keep this bit at a one long enough to ensure the reset sequence, as specified in the USB Specification Revision 2.0, completes. Note: when software writes this bit to a one, it must also write a zero to the Port Enable bit. Note that when software writes a zero to this bit there may be a delay before the bit status changes to a zero. The bit status will not read as a zero until after the reset has completed. If the port is in high-speed mode after reset is complete, the host controller will automatically enable this port (e.g. set the Port Enable bit to a one). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from a one to a zero. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2ms of software writing this bit to a zero. The HCHalted bit in the USBSTS register should be a zero before software attempts to use this bit. The host controller may hold Port Reset asserted to a one when the HCHalted bit is a one. This field is zero if Port Power is zero.
[7]	Suspend	Suspend (R/W) 1=Port in suspend state. 0=Port not in suspend state. Default = 0. Port Enabled Bit and Suspend bit of this register define the port states as follows: Bits [Port Enabled, Suspend] Port State OX Disable 10 Enable 11 Suspend When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB. A write of zero to this bit is ignored by the host controller. The host controller will unconditionally set this bit to a zero when: Software sets the Force Port Resume bit to a zero (from a one). Software sets the Port Reset bit to a one (from a zero). If host software sets this bit to a one when the port is not enabled (i.e. Port enabled bit is a zero) the results are undefined. This field is zero if Port Power is zero.

Publication Release Date: Oct 01, 2008

Revision: A2

[6]	FPResum	Force Port Resume (R/W) 1= Resume detected/driven on port. 0=No resume (Kstate) detected/driven on port. Default = 0. This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are a one) and software transitions this bit to a one, then the effects on the bus are undefined. Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to a 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to a one because a J-to-K transition is detected, the Port Change Detect bit in the USBSTS register is also set to a one. If software sets this bit to a one, the host controller must not set the Port Change Detect bit. Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains a one. Software must appropriately time the Resume and set this bit to a zero when the appropriate amount of time has elapsed. Writing a zero (from one) causes the port to return to high-speed mode (forcing the bus below the port into a high-speed idle). This bit will remain a one until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to a zero. This field is zero if Port Power is zero.
[5]	осснб	Over-current Change (R/WC) Default = 0. 1=This bit gets set to a one when there is a change to Over-current Active. Software clears this bit by writing a one to this bit position.
[4]	ОСАСТ	Over-current Active (RO) Default = 0. 1=This port currently has an over current condition. 0=This port does not have an over-current condition. This bit will automatically transition from a one to a zero when the over current condition is removed.
[3]	PENCHG	Port Enable/Disable Change (R/WC) 1=Port enabled/disabled status has changed. 0=No change. Default = 0. For the root hub, this bit gets set to a one only when a port is disabled due to the appropriate conditions existing at the EOF2 point (See Chapter 11 of the USB Specification for the definition of a Port Error). Software clears this bit by writing a 1 to it. This field is zero if Port Power is zero.

Publication Release Date: Oct 01, 2008

Revision: A2

[2]	PEN	Port Enabled/Disabled (R/W) 1=Enable. 0=Disable. Default = 0. Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a one to this field. The host controller will only set this bit to a one when the reset sequence determines that the attached device is a high-speed device. Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. When the port is disabled (0b) downstream propagation of data is blocked on this port, except for reset. This field is zero if Port Power is zero.
[1]	CSCHG	Connect Status Change (R/W) 1=Change in Current Connect Status. 0=No change. Default = 0. Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be "setting" an already-set bit (i.e., the bit will remain set). Software sets this bit to 0 by writing a 1 to it. This field is zero if Port Power is zero.
[0]	CSTS	Current Connect Status (RO) 1=Device is present on port. 0=No device is present. Default = 0. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. This field is zero if Port Power is zero.

Publication Release Date: Oct 01, 2008

Bits	Descriptions	
[11]	ClkValid	UTMI Clock Valid This bit is a flag to indicate if the UTMI clock from USB 2.0 PHY is ready. S/W program must prevent to write other control registers before this UTMI clock valid flag is active. 1'b0: UTMI clock is not valid 1'b1: UTMI clock is valid
[8]	Suspend	Suspend Assertion This bit controls the suspend mode of USB PHY 0. While PHY was suspended, all circuits of PHY were powered down and outputs are tri-stated. This bit is 1'b0 in default. This means the USB PHY 0 is suspended in default. It is necessary to set this bit 1'b1 to make USB PHY 0 leave suspend mode before doing configuration of USB host. 1'b0: USB PHY 0 was suspended. 1'b1: USB PHY 0 was not suspended.
[7]	CLK48	Digital Logic Clock Select This bit controls the input signal clk48m_sel of USB PHY 0. This signal selects Power-Save mode. 1'b0: Non-Power-Save mode. The PLL and the phase interpolator are powered up. The digital logic uses a 480MHz clock. Non-Power-Save mode is valid in all modes and speeds of operation. 1'b1: Power-Save mode. The PLL and the phase interpolator are powered down. The digital logic uses a 48MHz clock. Power-Save mode is valid for only FS-Only operation. The CLK_SEL should be set to 2'b10 (48MHz) when this bit is high.
[6]	REFCLK	Reference Clock Source Select This bit has to set to 1.
[5:4]	CKL_SEL	Reference Clock Frequency Select This field has to set to 2'b10;

Publication Release Date: Oct 01, 2008

Revision: A2

[3]	XO_ON	Force XO Block on During a Suspend This bit controls the input signal xo_on of USB PHY 0. 1'b0: If all ports are suspended, the XO block is powered up, and the test_clk48m signal is available. 1'b1: This bit is inactive, and the XO block is powered down when all ports are suspended.
[2]	SIDDQ	IDDQ Test Enable This bit controls the input signal siddq of USB PHY 0. This signal powers down all analog blocks. 1'b0: The analog blocks are in normal operation. 1'b1: The analog blocks are powered down.

USB PHY 1 Control Register (USBPCR1)

Register	Address	R/W	Description	Reset Value
USBPCR1	0xB000_50C8	R/W	USB PHY 1 Control Register	0x0000_0020

31	30	29	28	27	26	25	24		
	Reserved								
23	22	21	20	19	18	17	16		
	Reserved								
15	14	13	12	11	10	9	8		
	Reserved				Res	erved	Suspend		
7	6	5	4	3	2	1	0		
CLK48	REFCLK	CLK_	SEL	XO_ON	SIDDQ	Rese	erved		

Bits	Descriptions	
[11]	XO_SEL	Clock Select for XO Block This bit should be set to 0 to define the XO block uses a 48MHz external clock supplied from PHY 0
[8]	Suspend	Suspend Assertion This bit controls the suspend mode of USB PHY 1. While PHY was suspended, all circuits of PHY were powered down and outputs are tri-stated. This bit is 1'b0 in default. This means the USB PHY 0 is suspended in default. It is necessary to set this bit 1'b1 to make USB PHY 0 leave suspend mode before doing configuration of USB host. 1'b0: USB PHY 1 was suspended. 1'b1: USB PHY 1 was not suspended.
[7]	CLK48	Digital Logic Clock Select This bit controls the input signal clk48m_sel of USB PHY 1. This signal selects Power-Save mode. 1'b0: Non-Power-Save mode. The PLL and the phase interpolator are powered up. The digital logic uses a 480MHz clock. Non-Power-Save mode is valid in all modes and speeds of operation. 1'b1: Power-Save mode. The PLL and the phase interpolator are powered down. The digital logic uses a 48MHz clock. Power-Save mode is valid for only FS-Only operation. The CLK_SEL should be set to 2'b10 (48MHz) when this bit is high.
[6]	REFCLK	Reference Clock Source Select This bit has to set to 0.
[5:4]	CKL_SEL	Reference Clock Frequency Select This field has to set to 2'b10.

Publication Release Date: Oct 01, 2008

Revision: A2

[3]	XO_ON	Force XO Block on During a Suspend This bit controls the input signal xo_on of USB PHY 0. 1'b0: If all ports are suspended, the XO block is powered up, and the test_clk48m signal is available. 1'b1: This bit is inactive, and the XO block is powered down when all ports are suspended.
[2]	SIDDQ	IDDQ Test Enable This bit controls the input signal siddq of USB PHY 0. This signal powers down all analog blocks. 1'b0: The analog blocks are in normal operation. 1'b1: The analog blocks are powered down.

Publication Release Date: Oct 01, 2008

[7:0]	Rev	Revision Indicates the Open HCI Specification revision number implemented by the Hardware. Host Controller supports 1.0 specification. (X.Y = XYh)

Publication Release Date: Oct 01, 2008

Revision: A2

Host Controller Control Register (HcControl)

Register	Address	R/W	Description	Reset Value
HcControl	0xB000_7004	R/W	Host Controller Control Register	0x0000_0000

31	30	29	28	27	26	25	24
			Rese	erved			
23	22	21	20	19	18	17	16
	Reserved						
15	14	13	12	11	10	9	8
		Reserved			RWakeEn	RWake	IntRoute
7	6	5	4	3	2	1	0
HcFunc BlkE		BlkEn	CtrlEn	ISOEn	PeriEn	CtrlBl	kRatio

Bits	Descriptions			
[10]	RWakeEn	Remote Wakeup Connected Enable If a remote wakeup signal is supported, this bit enables that operation. Since there is no remote wakeup signal supported, this bit is ignored.		
[9]	RWake	Remote Wakeup Connected This bit indicated whether the HC supports a remote wakeup signal. This implementation does not support any such signal. The bit is hard-coded to '0.'		
[8]	IntRoute	Interrupt Routing This bit is used for interrupt routing: 0: Interrupts routed to normal interrupt mechanism (INT). 1: Interrupts routed to SMI.		
[7:6]	HcFunc	Host Controller Functional State This field sets the Host Controller state. The Controller may force a state change from USBSUSPEND to USBRESUME after detecting resume signaling from a downstream port. States are: 00: USBRESET 01: USBRESUME 10: USBOPERATIONAL 11: USBSUSPEND		
[5]	BlkEn	Bulk List Enable When set this bit enables processing of the Bulk list.		
[4]	CtrlEn	Control List Enable When set this bit enables processing of the Control list.		
[3]	ISOEn	Isochronous List Enable When clear, this bit disables the Isochronous List when the Periodic List is enabled (so Interrupt EDs may be serviced). While processing the Periodic List, the Host Controller will check this bit when it finds an isochronous ED.		

Publication Release Date: Oct 01, 2008

Revision: A2

[2]	PeriEn	Periodic List Enable When set, this bit enables processing of the Periodic (interrupt and isochronous) list. The Host Controller checks this bit prior to attempting any periodic transfers in a frame.	
[1:0]	CtrlBlkRatio	Control Bulk Service Ratio Specifies the number of Control Endpoints serviced for every Bulk Endpoint. Encoding is N-1 where N is the number of Control Endpoints (i.e. '00' = 1 Control Endpoint; '11' = 3 Control Endpoints)	

Publication Release Date: Oct 01, 2008

Revision: A2

Host Controller Command Status Register (HcComSts)

			Rese	rved			
7	6	5	4	3	2	1	0
	Reserved				BlkFill	CtrlFill	HCReset

Bits	Descriptions			
[17:16]	SchOverRun	Schedule Overrun Count This field is increment every time the SchedulingOverrun bit in HcInterruptStatus is set. The count wraps from '11' to '00.'		
[3]	OCReq	Ownership Chang Request When set by software, this bit sets the OwnershipChange field in HcInterruptStatus. The bit is cleared by software.		
[2]	BlkFill	Bulk List Filled Set to indicate there is an active ED on the Bulk List. The bit may be set by either software or the Host Controller and cleared by the Host Controller each time it begins processing the head of the Bulk List.		
[1]	CtrlFill	Control List Filled Set to indicate there is an active ED on the Control List. It may be set by either software or the Host Controller and cleared by the Host Controller each time it begins processing the head of the Control List.		
[0]	HCReset	Host Controller Reset This bit is set to initiate the software reset. This bit is cleared by the Host Controller, upon completed of the reset operation.		

Publication Release Date: Oct 01, 2008

7	6	5	4	3	2	1	0
	DPortNum						

Bits	Descriptions	
[31:24]	PwrGDT	Power On to Power Good Time This field value is represented as the number of 2 ms intervals, which ensuring that the power switching is effective within 2 ms. Only bits [25:24] are implemented as R/W. The remaining bits are read only as '0'. It is not expected that these bits be written to anything other than 1h, but limited adjustment is provided. This field should be written to support system implementation. This field should always be written to a non-zero value.
[12]	NOCP	No Over Current Protection This bit should be written to support the external system port over-current implementation. 0 = Over-current status is reported 1 = Over-current status is not reported
[11]	ОСРМ	Over Current Protection Mode This bit should be written 0 and is only valid when NOCP bit is cleared. 0 = Global Over-Current 1 = Individual Over-Current
[10]	DevType	Device Type
[9]	NPS	No Power Switching This bit should be written to support the external system port power switching implementation. 0 = Ports are power switched. 1 = Ports are always powered on.
[8]	PSM	Power Switching Mode This bit is only valid when NoPowerSwitching is cleared. This bit should be written '0'. 0 = Global Switching 1 = Individual Switching
[7:0]	DPortNum	Number Downstream Ports

Publication Release Date: Oct 01, 2008

Revision: A2

Bits	Descriptions	
[20]	PRSC	Port Reset Status Change This bit indicates that the port reset signal has completed. 0 = Port reset is not complete. 1 = Port reset is complete.
[19]	POCIC	Port Over Current Indicator Change This bit is set when OverCurrentIndicator changes. Writing a '1' clears this bit. Writing a '0' has no effect.
[18]	PSSC	Port Suspend Status Change This bit indicates the completion of the selective resume sequence for the port. 0 = Port is not resumed. 1 = Port resume is complete.
[17]	PESC	Port Enable Status Change This bit indicates that the port has been disabled due to a hardware event (cleared PortEnableStatus). 0 = Port has not been disabled. 1 = PortEnableStatus has been cleared.
[16]	CSC	Connect Status Change This bit indicates connect or disconnect event has been detected. Writing a '1' clears this bit. Writing a '0' has no effect. 0 = No connect/disconnect event. 1 = Hardware detection of connect/disconnect event. Note: If DeviceRemoveable is set, this bit resets to '1'.

Publication Release Date: Oct 01, 2008

Revision: A2

[9]	LSDev	(Read) LowSpeedDeviceAttached This bit defines the speed (and bud idle) of the attached device. It is only valid when CurrentConnectStatus is set. 0 = Full Speed device 1 = Low Speed device (Write) ClearPortPower Writing a '1' clears PortPowerStatus. Writing a '0' has no effect
[8]	PPS	(Read) PortPowerStatus This bit reflects the power state of the port regardless of the power switching mode. 0 = Port power is off. 1 = Port power is on. Note: If NoPowerSwitching is set, this bit is always read as '1'. (Write) SetPortPower Writing a '1' sets PortPowerStatus. Writing a '0' has no effect.
[4]	PR	(Read) PortResetStatus 0 = Port reset signal is not active. 1 = Port reset signal is active. (Write) SetPortReset Writing a '1' sets PortResetStatus. Writing a '0' has no effect.
[3]	РОС	(Read) PortOverCurrentIndicator HYDRA-2 supports global over-current reporting. This bit reflects the state of the OVRCUR pin dedicated to this port. This field is only valid if NoOverCurrentProtection is cleared and OverCurrentProtectionMode is set. 0 = No over-current condition 1 = Over-current condition (Write) ClearPortSuspend Writing a '1' initiates the selective resume sequence for the port. Writing a '0' has no effect.
[2]	PS	(Read) PortSuspendStatus 0 = Port is not suspended 1 = Port is selectively suspended (Write) SetPortSuspend Writing a '1' sets PortSuspendStatus. Writing a '0' has no effect.
[1]	PE	(Read) PortEnableStatus 0 = Port disabled. 1 = Port enabled. (Write) SetPortEnable Writing a '1' sets PortEnableStatus. Writing a '0' has no effect.
[0]	сс	(Read) CurrentConnectStatus 0 = No device connected. 1 = Device connected. NOTE: If DeviceRemoveable is set (not removable) this bit is always '1'. (Write) ClearPortEnable Writing '1' a clears PortEnableStatus. Writing a '0' has no effect.

7	6	5	4	3	2	1	0		
	Reserved OCALow Reserved ABORT								

Bits	Descriptions	
[8]	SIEPDis	SIE Pipeline Disable When set, waits for all USB bus activity to complete prior to returning completion status to the List Processor. This is a failsafe mechanism to avoid potential problems with the clk_dr transition between 1.5 MHz and 12 MHz.
[3]	OCALow	Over Current Active Low This bit controls the polarity of over current flag from external power IC. 0: Over current flag is high active 1: Over current flag is low active
[1]	ABORT	AHB Bus ERROR Response This bit indicates there is an ERROR response received in AHB bus. 0: No ERROR response received 1: ERROR response received
[0]	DBR16	Data Buffer Region 16 When set, the size of the data buffer region is 16 bytes. Otherwise, the size is 32 bytes.

7.8 USB 2.0 Device Controller

The W90P950 USB Device Controller is compliant to the USB Specification version 2.0. It also supports the software control for device remote-wakeup and 6 configurable endpoints in addition to Control Endpoint. Each of these endpoints can be Isochronous, Bulk or Interrupt and they can be either of IN or OUT direction with maximum packet size up to 1024 bytes. Three different modes of operation (Auto validation mode, manual validation mode and Fly mode) are supported for IN-endpoint.

7.8.1 USB Device Register Group Summary

Register Groups	Description
Main Control Registers	These set of registers control the global enable of interrupts and maintain the status of the interrupts
USB Control Registers	These set of registers control the USB related events to/from the USB host and hold the status of the USB events.
Control Endpoint Registers	These set of registers direct the control endpoint in handling the USB requests from the host and hold the status information of the transactions.
Non control Endpoint Registers	These set of registers configure, control and exhibit the status of the non-control endpoints' operation
DMA Registers	These registers are responsible for the DMA related operations

Bits	Descriptio	ns
[7]	EPF_INT	This bit conveys the interrupt for Endpoints F. When set, the corresponding Endpoint F's interrupt status register should be read to determine the cause of the interrupt.
[6]	EPE_INT	This bit conveys the interrupt for Endpoints E. When set, the corresponding Endpoint E's interrupt status register should be read to determine the cause of the interrupt.
[5]	EPD_INT	This bit conveys the interrupt for Endpoints D. When set, the corresponding Endpoint D's interrupt status register should be read to determine the cause of the interrupt.
[4]	EPC_INT	This bit conveys the interrupt for Endpoints C. When set, the corresponding Endpoint C's interrupt status register should be read to determine the cause of the interrupt.
[3]	EPB_INT	This bit conveys the interrupt for Endpoints B. When set, the corresponding Endpoint B's interrupt status register should be read to determine the cause of the interrupt.
[2]	EPA_INT	This bit conveys the interrupt for Endpoints A. When set, the corresponding Endpoint A's interrupt status register should be read to determine the cause of the interrupt.
[1]	CEP_INT	Control Endpoint Interrupt. This bit conveys the interrupt status for control endpoint. When set, Control-ep's interrupt status register should be read to determine the cause of the interrupt.
[0]	USB_INT	USB Interrupt. The interrupt status for USB specific events endpoint. When set, USB interrupt status register should be read to determine the cause of the interrupt.

Bits	Descriptions	
[6]	TCLKOK_IS	Usable Clock Interrupt. This bit is set when usable clock is available from the transceiver. Writing `1" clears this bit.
[5]	DMACOM_IS	DMA Completion Interrupt. This bit is set when the DMA transfer is over. Writing `1" clears this bit.
[4]	HISPD_IS	High Speed Settle. This bit is set when the valid high-speed reset protocol is over and the device has settled is high-speed. Writing '1" clears this bit.
[3]	sus_is	Suspend Request. This bit is set as default and it has to be cleared by writing '1' before the USB reset. This bit is also set when a USB Suspend request is detected from the host. Writing '1' clears this bit.
[2]	RUM_IS	Resume. When set, this bit indicates that a device resume has occurred. Writing a '1' clears this bit.
[1]	RST_IS	Reset Status. When set, this bit indicates that either the USB root port reset is end. Writing a '1' clears this bit.
[0]	SOF_IS	SOF. This bit indicates when a start-of-frame packet has been received. Writing a `1' clears this bit.

		Reserved			CUR_SPD	SET_HISPD	GEN_RUM

Bits	Descriptions	
[2]	CUR_SPD	USB Current Speed. When set, this bit indicates that the DEVICE CONTROLLER has settled in High Speed and a zero indicates that the device has settled in Full Speed
[1]	SET_HISPD	USB High Speed. When set to one, this bit indicates the DEVICE CONTROLLER to initiate a chirp-sequence during reset protocol. When set to zero, it indicates the DEVICE CONTROLLER to suppress the chirp-sequence during reset protocol, thereby allowing the DEVICE CONTROLLER to settle in full-speed, even though it is connected to a USB2.0 Host.
[0]	GEN_RUM	Generate Resume. Writing a 1 to this bit causes a Resume sequence to be initiated to the host if device remote wakeup is enabled. This bit is self-clearing.

Publication Release Date: Oct 01, 2008

Revision: A2

USB Frame Count Register (USB_FRAME_CNT)

Register	Address	R/W	Description	Default Value
USB_FRAME_CNT	0xB000_601C	R	USB Frame Count Register	0x0000_0000

31	30	29	28	27	26	25	24

Bits	Descriptions	Descriptions			
[15:0]	DATA_BUF	Control-ep Data Buffer. Bits [15:8] of this register provide the high order byte and bits [7:0] of this register provide the lower order byte for the buffer transaction (read or write).			

Publication Release Date: Oct 01, 2008

Revision: A2

Control-ep Control and Status (CEP_CTRL_STAT)

Register	Address	R/W	Description	Default Value
CEP_CTRL_STAT	0xB000_602C	RW	Control-ep Control and Status	0x0000_0000

31	30	29	28	27	26	25	24		
	Reserved								
23	22	21	20	19	18	17	16		
	Reserved								
15	14	13	12	11	10	9	8		
	Reserved								
7	6	5	4	3	2	1	0		
	Reserved				ZEROLEN	STLALL	NAK_CLEAR		

Bits	Descriptions	
[3]	FLUSH	CEP-FLUSH Bit. Writing 1 to this bit cause the packet buffer and its corresponding CEP_AVL_CNT register to be cleared. This bit is self-cleaning.
[2]	ZEROLEN	ZEROLEN Bit. This bit is valid for auto validation mode only. When this bit is set, DEVICE CONTROLLER can send a zero length packet to the host during Data stage to an IN token. This bit gets cleared once the zero length data packet is sent. So, the local CPU need not write again to clear this bit.
[1]	STLALL	STALL. This bit is a read/write bit. When this stall bit is set, the control endpoint sends a stall handshake in response to any in or out token thereafter. This is typically used for response to invalid/unsupported requests. When this bit is being set the NAK clear bit has to be cleared at the same time since the NAK clear bit has highest priority than STALL. It is automatically cleared on receipt of a next setup-token. So, the local CPU need not write again to clear this bit. NOTE: ONLY when CPU write data [1:0] is 2'b10 or 2'b00, this bit can be updated.
[0]	NAK_CLEAR	NAK_CLEAR. This is a read/write bit. This bit plays a crucial role in any control transfer. It bit is set to one by the DEVICE CONTROLLER, whenever a setup token is received. The local CPU can take its own time to finish off any house-keeping work based on the request and then clear this bit. Unless the bit is being cleared by the local CPU by writing zero, the DEVICE CONTROLLER will be responding with NAKs for the subsequent status phase. This mechanism holds the host from moving to the next request, until the local CPU is also ready to process the next request. NOTE: ONLY when CPU write data [1:0] is 2'b10 or 2'b00, this bit can be updated.

Bits	Descriptions	
[12]	EMPTY_IE	Buffer Empty Interrupt. This bit enables the buffer empty interrupt.
[11]	FULL_IE	Buffer Full Interrupt. This bit enables the buffer full interrupt.
[10]	STACOM_IE	Status Completion Interrupt. This bit enables the Status Completion interrupt.
[9]	ERR_IE	USB Error Interrupt. This bit enables the USB Error interrupt.
[8]	STALL_IE	STALL Sent Interrupt. This bit enables the STALL sent interrupt
[7]	NAK_IE	NAK Sent Interrupt. This bit enables the NAK sent interrupt.
[6]	DATA_RxED_IE	Data Packet Received Interrupt. This bit enables the data received interrupt.
[5]	DATA_TxED_IE	Data Packet Transmitted Interrupt. This bit enables the data packet transmitted interrupt.
[4]	PING_IE	Ping Token Interrupt. This bit enables the ping token interrupt.
[3]	IN_TK_IE	In Token Interrupt. This bit enables the in token interrupt

Publication Release Date: Oct 01, 2008

Revision: A2

[2]	OUT_TK_IE	Out Token Interrupt. This bit enables the out token interrupt.
[1]	SETUP_PK_IE	Setup Packet Interrupt. This bit enables the setup packet interrupt.
[0]	SETUP_TK_IE	Setup Token Interrupt Enable. This bit enables the setup token interrupt.

Publication Release Date: Oct 01, 2008

NAK_IS	DATA_RxED_IS	DATA_TxED_IS	PING_IS	IN_TK_IS	OUT_TK_IS	SETUP_PK_IS	SETUP_TK_IS		

Bits	Descriptions	
[12]	EMPTY_IS	Buffer Empty Interrupt. (Read Only) This bit is set when the control-ednpt buffer is empty.
[11]	FULL_IS	Buffer Full Interrupt. (Write "1" Clear) This bit is set when the control-endpt buffer is full.
[10]	STACOM_IS	Status Completion Interrupt. (Write "1" Clear) This bit is set when the status stage of a USB transaction has completed successfully.
[9]	ERR_IS	USB Error Interrupt. (Write "1" Clear) This bit is set when an error had occurred during the transaction.
[8]	STALL_IS	STALL Sent Interrupt. (Write "1" Clear) This bit is set when a stall-token is sent in response to an in/out token
[7]	NAK_IS	NAK Sent Interrupt. (Write "1" Clear) This bit is set when a nak-token is sent in response to an in/out token
[6]	DATA_RxED_IS	Data Packet Received Interrupt . (Write "1" Clear) This bit is set when a data packet is successfully received from the host for an out-token and an ack is sent to the host.
[5]	DATA_TxED_IS	Data Packet Transmitted Interrupt. (Write "1" Clear) This bit is set when a data packet is successfully transmitted to the host in response to an in-token and an ack-token is received for the same.
[4]	PING_IS	Ping Token Interrupt. (Write "1" Clear) This bit is set when the control-endpt receives a ping token from the host.

Publication Release Date: Oct 01, 2008

Revision: A2

[3]	IN_TK_IS	In Token Interrupt. (Write "1" Clear) This bit is set when the control-endpt receives an in token from the host.
[2]	OUT_TK_IS	Out Token Interrupt. (Write "1" Clear) This bit is set when the control-endpoint receives an out token from the host.
[1]	SETUP_PK_IS	Setup Packet Interrupt. (Write "1" Clear) This bit is set when a setup packet has been received from the host. This bit must be cleared (by writing a 1) before the next setup packet can be received. If the bit is not cleared, then the successive setup packets will be overwritten in the setup packet buffer.
[0]	SETUP_TK_IS	Setup Token Interrupt. (Write "1" Clear) This bit indicates when a setup token is received. Writing a 1 clears this status bit

Publication Release Date: Oct 01, 2008

15	14	13	12	11	10	9	8			
	Reserved									
7	6	5	4	3	2	1	0			
	IN_TRF_CNT									

Bits	Descriptions	Descriptions					
[7:0]	IN_TRF_CNT	In-transfer data count. There is no mode selection for the control endpoint (but it operates like manual mode). The local-CPU has to fill the controlendpoint buffer with the data to be sent for an in-token and to write the count of bytes in this register. When zero is written into this field, a zero length packet is sent to the host. When the count written in the register is more than the MPS, the data sent will be of only MPS.					

Publication Release Date: Oct 01, 2008

Revision: A2

	Reserved									
7	6	5	4	3	2	1	0			
RST_DMA	SCAT_GA_EN	DMA_EN	DMA_RD	DMA_ADDR						

Bits	Descriptions	
[7]	RST_DMA	Reset DMA state machine.
[6]	SCAT_GA_EN	Scatter gather function enable
[5]	DMA_EN	DMA Enable Bit
[4]	DMA_RD	DMA Operation Bit. If `1', the operation is a DMA read and if `0' the operation is a DMA write.
[3:0]	DMA_ADDR	DMA ep_addr Bits

When enable scatter gather DMA function, SCAT_GA_EN needs to be set high and DMA_CNT set to 8 bytes. Then DMA will enable to fetch the descriptor which describes the real memory address and length. The descriptor will be a

8-byte format, like the following:

[31]	[30]	[29:0]					
	MEM_ADDR[31:0]						
EOT							

MEM_ADDR: It specifies the memory address (AHB address).

EOT: end of transfer. When this bit sets to high, it means this is the last descriptor. **RD**: "1" means read from memory into buffer. "0" means read from buffer into memory.

Publication Release Date: Oct 01, 2008

Bits	Descriptions	
[12]	O_SHORT_PKT_IS	Bulk Out Short Packet Received (Writing a '1' clears this bit.) Received bulk out short packet (including zero length packet)
[11]	ERR_IS	ERR Sent. (Writing a '1' clears this bit.) This bit is set when there occurs any error in the transaction.
[10]	NYET_IS	NYET Sent. (Writing a `1' clears this bit.) This bit is set when the space available in the RAM is not sufficient to accommodate the next on coming data packet.
[9]	STALL_IS	USB STALL Sent. (Writing a '1' clears this bit.) The last USB packet could not be accepted or provided because the endpoint was stalled, and was acknowledged with a STALL.
[8]	NAK_IS	USB NAK Sent. (Writing a `1' clears this bit.) The last USB IN packet could not be provided, and was acknowledged with a NAK.
[7]	PING_IS	PING Token Interrupt. (Writing a `1' clears this bit.) This bit is set when a Data IN token has been received from the host.

Publication Release Date: Oct 01, 2008

Revision: A2

[6]	IN_TK_IS	Data IN Token Interrupt. (Writing a `1' clears this bit.) This bit is set when a Data IN token has been received from the host.
[5]	OUT_TK_IS	Data OUT Token Interrupt. (Writing a `1' clears this bit.) This bit is set when a Data OUT token has been received from the host. This bit also set by PING tokens (in high-speed only).
[4]	DATA_RxED_IS	Data Packet Received Interrupt. (Writing a '1' clears this bit.) This bit is set when a data packet is received from the host by the endpoint.
[3]	DATA_TxED_IS	Data Packet Transmitted Interrupt. (Writing a '1' clears this bit.) This bit is set when a data packet is transmitted from the endpoint to the host.
[2]	SHORT_PKT_IS	Short Packet Transferred Interrupt. (Writing a '1' clears this bit.) This bit is set when the length of the last packet was less than the Maximum Packet Size (EP_MPS).
[1]	EMPTY_IS	Buffer Empty. (READ ONLY) For an IN endpoint, a buffer is available to the local side for writing up to FIFO full of bytes. This bit is set when the endpoint buffer is empty. For an OUT endpoint, the currently selected buffer has a count of 0, or no buffer is available on the local side (nothing to read).
[0]	FULL_IS	Buffer Full. (READ ONLY) This bit is set when the endpoint packet buffer is full. For an IN endpoint, the currently selected buffer is full, or no buffer is available to the local side for writing (no space to write). For an OUT endpoint, there is a buffer available on the local side, and there are FIFO full of bytes available to be read (entire packet is available for reading).

Publication Release Date: Oct 01, 2008

PING_IE	IN_TK_IE	OUT_TK_IE	DATA_RxED_IE	DATA_TxED_IE	SHORT_PKT_IE	EMPTY_IE	FULL_IE	

Bits	Descriptions	
[12]	O_SHORT_PKT_IE	Bulk Out Short Packet Interrupt Enable When set, this bit enables a local interrupt to be set whenever bulk out short packet occurs on the bus for this endpoint.
[11]	ERR_IE	ERR interrupt Enable. When set, this bit enables a local interrupt to be set whenever ERR condition occurs on the bus for this endpoint.
[10]	NYET_IE	NYET Interrupt Enable. When set, this bit enables a local interrupt to be set whenever NYET condition occurs on the bus for this endpoint.
[9]	STALL_IE	USB STALL Sent Interrupt Enable. When set, this bit enables a local interrupt to be set when a stall token is sent to the host.
[8]	NAK_IE	USB NAK Sent Interrupt Enable. When set, this bit enables a local interrupt to be set when a nak token is sent to the host.

Publication Release Date: Oct 01, 2008

Revision: A2

[7]	PING_IE	PING Token Interrupt Enable. When set, this bit enables a local interrupt to be set when a ping token has been received from the host.
[6]	IN_TK_IE	Data IN Token Interrupt Enable. When set, this bit enables a local interrupt to be set when a Data IN token has been received from the host.
[5]	OUT_TK_IE	Data OUT Token Interrupt Enable. When set, this bit enables a local interrupt to be set when a Data OUT token has been received from the host.
[4]	DATA_RxED_IE	Data Packet Received Interrupt Enable. When set, this bit enables a local interrupt to be set when a data packet has been transmitted to the host.
[3]	DATA_TxED_IE	Data Packet Transmitted Interrupt Enable. When set, this bit enables a local interrupt to be set when a data packet has been received from the host.
[2]	SHORT_PKT_IE	Short Packet Transferred Interrupt Enable. When set, this bit enables a local interrupt to be set when a short data packet has been transferred to/from the host.
[1]	EMPTY_IE	Buffer Empty Interrupt. When set, this bit enables a local interrupt to be set when a buffer empty condition is detected on the bus.
[0]	FULL_IE	Buffer Full Interrupt. When set, this bit enables a local interrupt to be set when a buffer full condition is detected on the bus.

DIS_BUF	PK_END	ZEROLEN	HALT	TOGGLE	MODE		BUF_FLUSH			

Bits	Descriptions	
[7]	DIS_BUF	Disable Buffer This bit is used to disable buffer (set buffer size to 1) when received a bulk out short packet.
[6]	PK_END	Packet End. This bit is applicable only in case of Auto-Validate Method. This bit is set to validate any remaining data in the buffer which is not equal to the MPS of the endpoint, and happens to be the last transfer.
[5]	ZEROLEN	Zerolen In. This bit is used to send a zero-length packet n response to an intoken. When this bit is set, a zero packet is sent to the host on reception of an in-token.
[4]	HALT	Endpoint Halt. This bit is used to send a stall handshake as response to the token from the host. When an Endpoint Set Feature (ep_halt) is detected by the local CPU, it must write a '1' to this bit.

Publication Release Date: Oct 01, 2008

Revision: A2

[3]	TOGGLE	Endpoint Toggle. This bit is used to clear the endpoint data toggle bit. Reading this bit returns the current state of the endpoint data toggle bit. The local CPU may use this bit, to initialize the end-point's toggle incase of reception of a Set Interface request or a Clear Feature (ep_halt) request from the host. Only when toggle bit is "1", this bit can be written into the inversed write data bit [3].				
[2:1]	MODE	MODE[2:1] 2'b00 2'b01 2'b10 2'b11 These bits are not valuill be activated when	the mode of operation of the in-endpoint. Mode Description Auto-Validate Mode Manual-Validate Mode Fly Mode Reserved. id for an out-endpoint. The auto validate mode in the reserved mode is selected. clained detailed in later sections)			
[0]	BUF_FLUSH	corresponding EP_AV	causes the packet buffer to be flushed and the /AIL register to be cleared. This bit is self-ould always be written after a configuration

7.9 DMA Controller (DMAC)

The DMA Controller provides a DMA (Direct Memory Access) function for FMI to exchange data between system memory (ex. SDRAM) and shared buffer (one 2048 bytes). Software just simply fills in the starting address and enables DMAC, and then you can let DMAC to handle the data transfer automatically.

There is one 2048 bytes shared buffer inside DMAC, separate into four 512 bytes ping-pong FIFO. It can provide multi-block transfers using ping-pong mechanism for FMI. Software can access these shared buffers directly when FMI is not in busy.

7.9.1 DMA Controller Registers Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W	Description	Reset Value					
Shared Buffer (DMAC_BA = 0xB000_C000)

		Rese	rved			FMI_BUSY	Reserved		
7	6	5	4	3	2	1	0		
Reserved				SG_EN2	Reserved	SW_RST	DMACEN		

Bits	Descriptions	
		FMI DMA Transfer is in progress
[9]	FMI_BUSY	This bit indicates if FMI is granted and doing DMA transfer or not. 0 = FMI DMA transfer is not in progress. 1 = FMI DMA transfer is in progress.
		Enable Scatter-Getter Function for FMI
[3]	SG_EN2	 Enable DMA scatter-getter function or not. 0 = Normal operation. DMAC will treat the starting address in DMACSAR2 as starting pointer of a single block memory. 1 = Enable scatter-getter operation. DMAC will treat the starting address in DMACSAR2 as a starting address of Physical Address Descriptor (PAD) table. The format of these PADs will be described later.
		Software Engine Reset
[1]	SW_RST	 0 = Writing 0 to this bit has no effect. 1 = Writing 1 to this bit will reset the internal state machine and pointers. The contents of control register will not be cleared. This bit will auto clear after few clock cycles.
		DMAC Engine Enable
[0]	DMACEN	Setting this bit to 1 enables DMAC's operation. If this bit is cleared, DMAC will ignore all DMA request from FMI and force Bus Master into IDLE state. 0 = Disable DMAC. 1 = Enable DMAC. NOTE: If target abort is occurred, DMACEN will be cleared.

Publication Release Date: Oct 01, 2008

Revision: A2

	DMACSA[15:8]									
7	6	5	4	3	2	1	0			
	DMACSA[7:0]									

Bits	Descriptions	
		DMA Transfer Starting Address for FMI
[31:0]	DMACSA	This field indicates a 32-bit starting address of system memory (SRAM/SDRAM) for DMAC to retrieve or fill in data (for FMI engine).
	Direct	If DMAC is not in normal mode, this field will be interpreted as a starting address of Physical Address Descriptor (PAD) table.

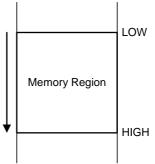

NOTE: Starting address should be word alignment, for example, 0x0000_0000, 0x0000_0004...

The format of PAD table must like below. Note that the total sector count of all PADs must be equal to or greater than the sector count filled in FMI engine. EOT should be set to 1 in the last descriptor.

sectors (bit 15~0)

EOT: End of PAD Table (bit 31)

Publication Release Date: Oct 01, 2008

[1]	WEOT_IE	• 0 = Disable interrupt generation when wrong EOT is encountered.
		ullet 1 = Enable interrupt generation when wrong EOT is encountered.
		DMA Read/Write Target Abort Interrupt Enable
[0]	TABORT_IE	0 = Disable target abort interrupt generation during DMA transfer.
	_	1 = Enable target abort interrupt generation during DMA transfer.

Publication Release Date: Oct 01, 2008

Revision: A2

DMAC Interrupt Status Register (DMACISR)

Register	Offset	R/W	Description	Reset Value
DMACISR	0xB000_C814	R/W	DMAC Interrupt Status Register	0x0000_0000

31	30	29	28	27	26	25	24		
	Reserved								
23	22	21	20	19	18	17	16		
	Reserved								
15	14	13	12	11	10	9	8		
	Reserved								
7	6	5	4	3	2	1	0		
		Rese	rved			WEOT_IF	TABORT_IF		

Bits	Descriptions	
[1]	WEOT_IF	Wrong EOT Encountered Interrupt Flag When DMA Scatter-Getter function is enabled, and EOT of the descriptor is encountered before DMA transfer finished (that means the total sector count of all PAD is less than the sector count of FMI), this bit will be set. 0 = No EOT encountered before DMA transfer finished. 1 = EOT encountered before DMA transfer finished.
[0]	TABORT_IF	NOTE: This bit is read only, but can be cleared by writing '1' to it. DMA Read/Write Target Abort Interrupt Flag 0 = No bus ERROR response received. 1 = Bus ERROR response received. NOTE: This bit is read only, but can be cleared by writing '1' to it.

NOTE: When DMAC's bus master received ERROR response, it means that target abort is happened. DMAC will stop transfer and respond this event to software, FMI; and then go to IDLE state. When target abort occurred or WEOT_IF is set, suggest software reset DMAC and IP, and then transfer those data again.

Publication Release Date: Oct 01, 2008

Revision: A2

7.10 Flash Memory Interface Controller (FMI)

The Flash Memory Interface (FMI) supports Secure Digital (SD and SDIO), Memory Stick (Memory stick PRO) and NAND-type flash. FMI is cooperated with DMAC to provide a fast data transfer between system memory and cards. There is one single 2048-byte buffer embedded in DMAC for temporary data storage. Due to DMAC only has single channel, that means only one interface can be active at the same time.

7.10.1 FMI Controller Registers Map

R: read only, W: write only, R/W: both read and write

7.10.2 Register Details

Global Control and Status Register (FMICSR)

Register	Address	R/W	Description	Reset Value
FMICSR	0xB000_D000	R/W	Global Control and Status Register	0x0000_0000

31	30	29	28	27	26	25	24	
	Reserved							
23	22	21	20	19	18	17	16	
	Reserved							
15	14	13	12	11	10	9	8	
	Reserved							
7	6	5	4	3	2	1	0	
	Reserved		CF_EN	SM_EN	MS_EN	SD_EN	SW_RST	

Bits	Descriptions	
		NAND-type Flash Functionality Enable
[3]	SM_EN	0 = Disable SM functionality of FMI.
		1 = Enable SM functionality of FMI.
		Memory Stick Functionality Enable
[2]	MS_EN	0 = Disable MS functionality of FMI.
		1 = Enable MS functionality of FMI.
		Secure Digital Functionality Enable
[1]	SD_EN	0 = Disable SD functionality of FMI.
		1 = Enable SD functionality of FMI.
		Software Engine Reset
[0]	SW DST	0 = Writing 0 to this bit has no effect.
[0]	SW_RST	1 = Writing 1 to this bit will reset all FMI engines. The contents of control register will not be cleared. This bit will auto clear after few clock cycles.

NOTE: Software can enable only one engine at one time, or FMI will work abnormal.

Publication Release Date: Oct 01, 2008

Revision: A2

Global Interrupt Control Register (FMIIER)

Register	Address	R/W	Description	Reset Value
FMIIER	0xB000_D004	R/W	Global Interrupt Control Register	0x0000_0001

7	6	5	4	3	2	1	0		
	Reserved								

Bits	Descriptions	
		DMAC READ/WRITE Target Abort Interrupt Flag (Read Only)
[0]	DTA_IF	This bit indicates DMAC received an ERROR response from internal AHB bus during DMA read/write operation. When Target Abort is occurred, please reset all engine.
[0]		0 = No bus ERROR response received.
		1 = Bus ERROR response received.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.

NOTE: No matter interrupt enable is turn on or not, the interrupt flag will be set when target condition is occurred.

Publication Release Date: Oct 01, 2008

Revision: A2

SD Control and Status Register (SDCSR)

Register	Address	R/W	Description	Reset Value
SDCSR	0xB000_D020	R/W	SD Control and Status Register	0x0101_0000

31	30	29	28	27	26	25	24		
Reserved	SDPORT		Reserved		SDNWR				
23	22	21	20	19	18	17	16

7	6	5 4 3 2 1 0							
CLK_KEEP0	CLK8_OE	CLK74_OE	R2_EN	DO_EN	DI_EN	RI_EN	CO_EN		

Bits	Descriptions					
520, 201	CD DOD=	SD Port Selection				
[30:29]	SDPORT	This field should be set to 00				
		N _{WR} Parameter for Block Write Operation				
[27:24]	SDNWR	This value indicates the N_{WR} parameter for data block write operation in clock counts. The actual clock cycle will be SDNWR+1.				
		Block Counts to Be Transferred or Received				
[23:16]	BLK_CNT	This field contains the block counts for data-in and data-out transfer. For READ_MULTIPLE_BLOCK and WRITE_MULTIPLE_BLOCK command, software can use this function to accelerate data transfer and improve performance. Note that only when SDBLEN=0x1FF, this field is valid. Otherwise, block counts will be set to 1 inside SD host engine.				
		NOTE: Value 0x0 in this field means 256.				
		SD Data Bus Width				
[15]	DBW	0 = Data bus width is 1-bit.				
		1 = Data bus width is 4-bit.				
		Software Engine Reset				
		0 = Writing 0 to this bit has no effect.				
[14]	SW_RST	1 = Writing 1 to this bit will reset the internal state machine and counters. The contents of control register will not be cleared (but RI_EN, DI_EN, DO_EN and R2_EN will be cleared). This bit will be auto cleared after few clock cycles.				
54.0.07		SD Command Code				
[13:8]	CMD_CODE	This register contains the SD command code (0x00 – 0x3F).				

Publication Release Date: Oct 01, 2008

Revision: A2

		SD Clock Enable for Port 0
[7]	CLK_KEEP0	0 = Disable SD clock generation.
		1 = SD clock always keeps free running.
		Generating 8 Clock Cycles Output Enable
[6]	CLIVE OF	0 = No effect.
[6]	CLK8_OE	1 = Enable, SD host will output 8 clock cycles.
		NOTE: When this operation is finished, this bit will be cleared automatically.
		Initial 74 Clock Cycles Output Enable
[5]	CLK74_OE	0 = No effect.
[2]	CLR/4_OE	1 = Enable, SD host will output 74 clock cycles to SD card.
		NOTE: When this operation is finished, this bit will be cleared automatically.
		Response R2 Input Enable
	R2_EN	0 = No effect. (Please use SDCSR [SW_RST] to clear this bit.)
[4]		1 = Enable, SD host will wait to receive a response R2 from SD card and store the response data into DMAC's flash buffer (exclude CRC-7).
		NOTE: When the R2 response is finished, this bit is cleared automatically.
		Data Output Enable
[2]	DO_EN	0 = No effect. (Please use SDCSR [SW_RST] to clear this bit.)
[3]		1 = Enable, SD host will transfer block data and the CRC-16 value to SD card.
		NOTE: When the output operation is finished, this bit is cleared automatically.
		Data Input Enable
		0 = No effect. (Please use SDCSR [SW_RST] to clear this bit.)
[2]	DI_EN	1 = Enable, SD host will wait to receive block data and the CRC-16 value from SD card.
		NOTE: When the input operation is finished, this bit will be cleared automatically.
		Response Input Enable
F4.7	DT	0 = No effect. (Please use SDCSR [SW_RST] to clear this bit.)
[1]	RI_EN	1 = Enable, SD host will wait to receive a response from SD card.
		NOTE: When the response operation is finished, this bit is cleared automatically.
		Command Output Enable
[0]	CO EN	0 = No effect.
[0]	CO_EN	1 = Enable, SD host will output a command to SD card.
		NOTE: When the command operation is finished, this bit is cleared automatically.

Publication Release Date: Oct 01, 2008

Revision: A2

SD Command Argument Register (SDARG)

Register	Address	R/W	Description	Reset Value
SDARG	0xB000_D024	R/W	SD Command Argument Register	0x0000_0000

31	30	29	28	27	26	25	24

	SD_CMD_ARG								
7	6	5	4	3	2	1	0		
	SD_CMD_ARG								

Bits	Descriptions	
		SD Command Argument
[31:0]	SD_CMD_ARG	This register contains a 32-bit value specifies the argument of SD command from host controller to SD card.

Publication Release Date: Oct 01, 2008

Revision: A2

SD Interrupt Control Register (SDIER)

Register	Address	R/W	Description	Reset Value
SDIER	0xB000_D028	R/W	SD Interrupt Control Register	0x0000_0000

31	30	29	28	27	26	25	24	
Reserved	CD0SRC			Rese	erved			
23	22	21	20	19	18	17	16	
	Reserved							
15	14	13	12	11	10	9	8	
Reserved	WKUP_EN	DITO_IE	RITO_IE	Reserved	SDIO0_IE	Reserved	CD0_IE	
7	6	5	4	3	2	1	0	
	Reserved						BLKD_IE	

Bits	Descriptions	
		SD0 Card Detect Source Selection
[30]	CD0SRC	• 0 = From SD0 card's DAT3 pin.
		• 1 = From GPIO pin.
		Wake-Up Signal Generating Enable
[14]	WKUP_EN	Enable/Disable wake-up signal generating of SD host when SDIO card (current using) issues an interrupt (wake-up) via DAT [1] to host.
	_	0 = Disable.
		1 = Enable.
[13]	DITO_IE	Data Input Time-out Interrupt Enable Enable/Disable interrupt generation of SD controller when data input time-out. Time-out value is specified at SDTMOUT. 0 = Disable. 1 = Enable.
[12]	RITO_IE	Response Time-out Interrupt Enable Enable/Disable interrupt generation of SD controller when receiving response or R2 time-out. Time-out value is specified at SDTMOUT. 0 = Disable. 1 = Enable.
_		SDIO Interrupt Enable for Port 0
[10]	SDIO0 IE	Enable/Disable interrupt generation of SD host when SDIO card 0 issues an interrupt via DAT [1] to host.
[-0]	3223 3_2	0 = Disable.
		1 = Enable.

Publication Release Date: Oct 01, 2008

Revision: A2

		SD0 Card Detection Interrupt Enable
[8]	CD0_IE	Enable/Disable interrupt generation of SD controller when card 0 is inserted or removed.
[-]	<u>-</u>	0 = Disable.
		1 = Enable.
		CRC-7, CRC-16 and CRC Status Error Interrupt Enable
[1]	CRC_IE	0 = SD host will not generate interrupt when CRC-7, CRC-16 and CRC status is error.
		1 = SD host will generate interrupt when CRC-7, CRC-16 and CRC status is error.
		Block Transfer Done Interrupt Enable
[0]	BLKD_IE	0 = SD host will not generate interrupt when data-in (out) transfer done.
		1 = SD host will generate interrupt when data-in (out) transfer done.

Publication Release Date: Oct 01, 2008

Revision: A2

SD Interrupt Status Register (SDISR)

Register	Address	R/W	Description	Reset Value
SDISR	0xB000_D02C	R/W	SD Interrupt Status Register	0x000X_008C

31	30	29	28	27	26	25	24		
	Reserved								
23	22	21	20	19	18	17	16		
	Reserved				SD0DAT1	Reserved	CDPS0		
15	14	13	12	11	10	9	8		
Rese	rved	DITO_IF	RITO_IF	Reserved	SDIO0_IF	Reserved	CD0_IF		
7	6	5	4	3	2	1	0		
SDDAT0	ATO CRCSTAT			CRC-16	CRC-7	CRC_IF	BLKD_IF		

Bits	Descriptions	
F4 07		DAT1 Pin Status of SD0 (Read Only)
[18]	SD0DAT1	This bit is the DAT1 pin status of SD0.
		Card Detect Pin Status of SD0 (Read Only)
[16]	CDPS0	This bit is the DAT3 pin status of SD0, and it is using for card detection. When there is a card inserted in or removed from SD0, software should check this bit to confirm if there is really a card insertion or remove.
		Data Input Time-out Interrupt Flag (Read Only)
	DITO_IF	This bit indicates that SD host counts to time-out value when receiving data (waiting start bit).
[13]		0 = Not time-out.
		1 = Data input time-out.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.
		Response Time-out Interrupt Flag (Read Only)
	RITO_IF	This bit indicates that SD host counts to time-out value when receiving response or R2 (waiting start bit).
[12]		0 = Not time-out.
		1 = Response time-out.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.
		SDIO 0 Interrupt Flag (Read Only)
		This bit indicates that SDIO card 0 issues an interrupt to host.
[10]	SDIO0_IF	0 = No interrupt is issued by SDIO card 0.
		1 = An interrupt is issued by SDIO card 0.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.

Publication Release Date: Oct 01, 2008

Revision: A2

		SD0 Card Detection Interrupt Flag (Read Only)
		This bit indicates that SD card 0 is inserted or removed. Only if SDIER [CD0_IE] is set to 1, this bit is active.
[8]	CD0_IF	0 = No card is inserted or removed.
		1 = There is a card inserted in or removed from SD0.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.
		DATO Pin Status of Current Selected SD (Read Only)
[7]	SDDAT0	This bit is the DAT0 pin status of current selected SD port.
		CRC Status Value of Data-out Transfer (Read Only)
		SD host will record CRC status of data-out transfer. Software could use this value to identify what type of error is during data-out transfer.
[6:4]	CRCSTAT	010 = Positive CRC status.
		101 = Negative CRC status
		111 = SD card programming error occurs.
		CRC-16 Check Status of Data-in Transfer (Read Only)
.	000.16	SD host will check CRC-16 correctness after data-in transfer.
[3]	[3] CRC-16	0 = Fault.
		1 = OK.
		CRC-7 Check Status (Read Only)
[2]	CRC-7	SD host will check CRC-7 correctness during each response in. If that response does not contain CRC-7 information (R3), then software should turn off SDIER [CRC_IE] and ignore this bit.
		0 = Fault.
		1 = OK.
		CRC-7, CRC-16 and CRC Status Error Interrupt Flag (Read Only)
[1]	CRC_IF	This bit indicates that SD host has occurred CRC error during response in, data-in or data-out (CRC status error) transfer. When CRC error is occurred, software should reset SD engine. Some response (ex. R3) doesn't have CRC-7 information with it; SD host will still calculate CRC-7, get CRC error and set this flag. In this condition, software should ignore CRC error and clears this bit manually.
		0 = No CRC error is occurred.
		1 = CRC error is occurred.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.

Publication Release Date: Oct 01, 2008

Revision: A2

		Block Transfer Done Interrupt Flag (Read Only)
[0]	BLKD_IF	This bit indicates that SD host has finished data-in or data-out block transfer. If there is a CRC-16 error or incorrect CRC status during multiple block data transfer, the transfer will be broken and this bit will be set. 0 = Not finished yet.
		1 = Done. NOTE: This bit is read only, but can be cleared by writing `1' to it.

Publication Release Date: Oct 01, 2008

Revision: A2

15	14	13	12	11	10	9	8		
	SDTMOUT								
7	6	5	4	3	2	1	0		
	SDTMOUT								

Bits	Descriptions	
		SD Response/Data-in Time-out Value
[23:0]	SDTMOUT	A 24-bit value specifies the time-out counts of response and data input. SD host controller will wait start bit of response or data-in until this value reached. The time period is depended on SD engine clock frequency. Do not write a small number into this field, or you may never get response or data due to time-out.
		NOTE: Fill 0x0 into this field will disable hardware time-out function.

Publication Release Date: Oct 01, 2008

Revision: A2

Memory Stick Control and Status Register (MSCSR)

Register	Address	R/W	Description	Reset Value
MSCSR	0xB000_D060	R/W	Memory Stick Control and Status Register	0x0000_0008

31	30	29	28	27	26	25	24	
	Reserved							
23	22	21	20	19	18	17	16	
Rese	Reserved MSPORT DS			DCNT DCNT				
15	14	13	12	11	10	9	8	
	Reserved				TI	PC		
7	6	5	4	3	2	1	0	
	Reserved				MSPRO	MS_GO	SW_RST	

Bits	Descriptions	
[24]	MCDODT	Memory Stick Port Selection
[21]	MSPORT	This bit should be set to 0
		Data Size for Transfer (for Memory Stick PRO Only)
		This field defines how many bytes should be transferred of following TPC codes. Data will be obtained from (stored in) DMAC's FIFO.
		READ_SHORT_DATA and WRITE_SHORT_DATA.
[20:19]	DSIZE	00 = 32 Bytes.
[01 = 64 Bytes.
		10 = 128 Bytes.
		11 = 256 Bytes.
		NOTE: This field is invalid when other TPC codes are executed.
		Data Count Number (in Byte Unit)
		This field defines how many bytes should be transferred of following TPC codes. Data will be obtained from (stored in) MSBUF1 and MSBUF2.
[10.16]	DCNT	READ_REG, GET_INT, WRITE_REG, SET_R/W_REG_ADRS, SET_CMD and EX_SET_CMD.
[18:16]	DCN1	For example, when software wants to use SET_R/W_REG_ADRS, you should write 0x4 into this field; when you want to use SET_CMD, you should write 0x1 into this field, etc.
		NOTE: Value 0x0 means 8 bytes should be transferred, and it is the largest length this core can provide.

Publication Release Date: Oct 01, 2008

Revision: A2

		TPC Code of the Packet
[11:8]	ТРС	This field defines the TPC code of the packet which software wants to transfer. This core supports all TPC code of Memory Stick and Memory Stick PRO specification. The lower 4 bits of TPC (TPC Check Code) will be generated by hardware automatically.
		Serial or Parallel Mode
[3]	SERIAL	0 = MS host is working at parallel mode.
		1 = MS host is working at serial mode (Default).
		Memory Stick or Memory Stick PRO
[2]	MSPRO	0 = Type of the card is Memory Stick.
		1 = Type of the card is Memory Stick PRO.
		Trigger Memory Stick Core to Transfer Packet
		0 = Writing 0 to this bit has no effect.
[1]	MS_GO	1 = Trigger Memory Stick core to transfer packet. When TPC code is READ_REG, GET_INT, WRITE_REG, SET_R/W_REG_ADRS, SET_CMD or EX_SET_CMD, data will be obtained from (stored in) MSBUF1 and MSBUF2. When TPC code is READ_LONG_DATA (READ_PAGE_DATA), READ_SHORT_DATA, WRITE_LONG_DATA (WRITE_PAGE_DATA) or WRITE_SHORT_DATA, data will be obtained from (stored in) DMAC's FIFO.
		Software Engine Reset
		0 = Writing 0 to this bit has no effect.
[0]	SW_RST	1 = Writing 1 to this bit will reset the internal state machine and counters. The contents of control register will not be cleared. This bit will be auto cleared after few clock cycles.

Publication Release Date: Oct 01, 2008

Revision: A2

Memory Stick Interrupt Control Register (MSIER)

Register	Address	R/W	Description	Reset Value

Bits	Descriptions	
		MS Card Detection 0 Interrupt Enable
[16]	CD0_IE	Enable/Disable Interrupt generation of MS controller when card 0 is inserted or removed.
	_	0 = Disable.
		1 = Enable.
		CRC-16 Error Interrupt Enable
[4]	CRC_IE	0 = the core will not generate interrupt when CRC-16 is error.
	_	1 = the core will generate interrupt when CRC-16 is error.
		Busy to Ready Check Timeout Interrupt Enable
[3]	BSYTO_IE	0 = Disable Busy to Ready check timeout interrupt.
		1 = Enable Busy to Ready check timeout interrupt.

Publication Release Date: Oct 01, 2008

Revision: A2

		INT Response Timeout Interrupt Enable			
[2]	INTTO_IE	0 = Disable INT response timeout interrupt generation.			
		1=Enable INT response timeout interrupt generation.			
		Memory Stick Card's Interrupt Enable			
		0 = the core will not generate interrupt when MS card generates INT.			
[1]	MSINT_IE	1 = the core will generate interrupt when MS card generates INT.			
[+]		NOTE: Software should set MSIER[INTTO_IE] to `1' to enable INT detection function of the core, and set this bit to `1' if you want to get INT from MS card.			
		Packet Transfer Done Interrupt Enable			
[0]	PKT_IE	0 = the core will not generate interrupt when packet transfer is done.			
		1 = the core will generate interrupt when packet transfer is done.			

Publication Release Date: Oct 01, 2008

Revision: A2

Memory Stick Interrupt Status Register (MSISR)

Register	Address	R/W	Description	Reset Value
MSISR	0xB000_D068	R/W	Memory Stick Interrupt Status Register	0x0000_0000

31	30	29	28	27	26	25	24
		Reserved	CD0_				
23	22	17	16				
		Reserved	CD0_IF				
15	14	13	12	11	10	9	8
	Reserved				BREQ	ERR	CED
7 6 5 4				3	2	1	0
Reserved CRC_IF				BSYTO_IF	INTTO_IF	MSINT_IF	PKT_IF

Bits	Descriptions	
		Pin Status of MS Card Detection 0 (Read Only)
[24]	CD0_	This is the pin status of MS card detection 0. When there is a card insertion or removal, software should check this bit to confirm if it is really a card insertion or removal.
		NOTE: Software should perform de-bounce for card detection function.
		MS Card Detection 0 Interrupt Flag (Read Only)
	CD0_IF	This bit indicates that MS card 0 is inserted or removed. Only if MSIER [CD0_IE] is set, this bit is active; otherwise, this bit is invalid.
[16]		0 = No card is inserted or removed.
		1 = There is a card inserted in or removed from MS0.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.
		INT Status of Memory Stick PRO (Read Only)
[11:8]	CMDNK BREQ ERR CED	These 4 bits indicates the INT status of Memory Stick PRO card (only for parallel mode). When MSIER [INTTO_IE] is set, the core will wait for INT signal from card. If the card is working at parallel mode; after INT is occurred (MSISR [MSINT_IF] is set), the contents of INT register can be informed by these bits.
		NOTE: These bits are valid in parallel mode only.

Publication Release Date: Oct 01, 2008

Revision: A2

		CRC-16 Error Interrupt Flag (Read Only)
[4]	CDC IF	When the packet transfer is done, the core will compare the value of CRC-16 which it calculated and received. If CRC-16 value is not the same, this flag will be set. The comparison executes only for READ packet.
[4]	CRC_IF	0 = CRC-16 ok.
		1 = CRC-16 failed.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.
		Busy to Ready Check Timeout Interrupt Flag (Read Only)
[3]	BSYTO_IF	This bit indicates that the core cannot detect RDY signal on DATA [0] pin during Handshake State. It means some errors are occurred during packet transfer. The maximum timeout duration for RDY signal is 16 SCLKs.
		0 = No RDY timeout occurred.
		1 = RDY timeout occurred.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.
		INT Response Timeout Interrupt Flag (Read Only)
[2]	INTTO_IF	This bit indicates that the core cannot detect INT signal of MS card after a period of time. In Memory Stick, the maximum period is 100ms. In Memory Stick PRO, the maximum period is 3500ms. If INT timeout is occurred, it means the card maybe malfunction.
		0 = INT detection is not timeout.
		1 = INT detection is timeout, no INT signal occurred.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.

		Memory Stick Card's Interrupt Flag (Read Only)
[1]	[1] MSINT_IF	Memory Stick will generate INT signal after some TPC codes are executed, ex. SET_CMD. This bit indicates that Memory Stick has generated INT signal after TPC code execution. This core will check INT for software only when MSIER [INTTO_IE] is set to '1', or this bit is invalid.
		0 = No INT signal is detected.
		1 = INT signal is detected.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.
		Packet Transfer Done Interrupt Flag (Read Only)
		This bit indicates that the whole packet transfer is done. The four states of Memory Stick are BS1, BS2, BS3 and BS0.
[0]	PKT_IF	0 = Packet transfer is not done yet.
		1 = Packet transfer is done.
		NOTE: This bit is read only, but can be cleared by writing '1' to it.

Publication Release Date: Oct 01, 2008

Revision: A2

NOTE: No matter interrupt is enabled or not, the interrupt flag is set when target condition is occurred.

ECC4CHK	Reserved	ECC4_EN	DBW	PSIZE	DWR_EN	DRD_EN	SW_RST	

Bits	Descriptions			
[26:25]	SM_CS	NAND Flash Select 00 = Select card 0. (-CE0 will be active) 01 = Reserved 11 = No card will be selected.		
[24]	WP_	Write Protect Pin Control 0 = Force -WP pin to LOW (0) level. 1 = Force -WP pin to HIGH (1) level.		
[11:8]	MECC4	Mask ECC4 During Write Page Data These 4 bits indicate NAND controller to write out ECC4 checksum or just 10 bytes 0xFF for each field. 0 = Do not mask the ECC4 checksum for each field. 1 = Mask ECC4 checksum and write out 10 bytes 0xFF to NAND.		
[7]	ECC4CHK	None Used Field ECC4 Check After Read Page Data 0 = Disable. NAND controller will always check ECC4 result for each field, no matter it is used or not. 1 = Enable. NAND controller will check 1's count for byte 2, 3 of redundandata in each field. If count value is greater than 8, NAND controller will treat this field as none used field; otherwise, it's used. If that field is none used field, NAND controller will ignore its ECC4 check result.		

Publication Release Date: Oct 01, 2008

Revision: A2

		ECC Algorithm Selection
[5]	ECC4_EN	This bit is used to select the ECC algorithm for data protecting. There are two ECC algorithms inside this NAND controller, one is the standard used in SmartMedia's specification and the other is Reed-Solomon code.
		0 = Using standard algorithm in SmartMedia specification.
		1 = Using Reed-Solomon code encode/decode.
		SM Data Bus Width
5.43		0 = Data bus width of NAND is 8-bit.
[4]	DBW	1 = Data bus width of NAND is reserved for 16-bit.
		This bit should be set to 0.
		Page Size of NAND-type Flash
		This bit indicates the page size of NAND. Only two sizes are supported.
[3]	PSIZE	0 = Page size is 512 Bytes. (512+16B)
		1 = Page size is 2048 Bytes. (2048+64B)
		DMA Write Data Enable
		This bit enables the SM host to transfer data from DMAC's embedded frame buffer into SmartMedia card or NAND type flash.
[2]	DWR_EN	0 = No effect.
		1 = Enable DMA read data transfer.
		NOTE: When DMA transfer completed, this bit will be cleared automatically.
		DMA Read Data Enable
		This bit enables the SM host to transfer data from SmartMedia card or NAND type flash into DMAC's embedded frame buffer.
[1]	DRD_EN	0 = No effect.
		1 = Enable DMA read data transfer.
		NOTE: When DMA transfer completed, this bit will be cleared automatically.
		Software Engine Reset
		0 = Writing 0 to this bit has no effect.
[0]	SW_RST	1 = Writing 1 to this bit will reset the internal state machine and counters (include SMCSR [DWR_EN] and SMCSR [DRD_EN]). The contents of control register will not be cleared. This bit will be auto cleared after few clock cycles.

Publication Release Date: Oct 01, 2008

7	6	5	4	3	2	1	0			
			LO_	WID						

Bits	Descriptions	
		CLE/ALE Setup/Hold Time
		This field controls the CLE/ALE setup/hold time to -WE.
		The setup/hold time can be calculated using following equation:
[22:16]	CALE_SH	$t_{CLS} = (CALE_SH+1)*T_{AHB}$
		$t_{CLH} = ((CALE_SH*2)+2)*T_{AHB}$
		$t_{ALS} = (CALE_SH+1)*T_{AHB}$
		$t_{ALH} = ((CALE_SH*2)+2)*T_{AHB}$
	HI_WID	Read/Write Enable Signal High Pulse Width
[15:8]		This field controls the high pulse width of signals –RE and –WE while H/W mode page access is enabled. The pulse width is a multiple of period of AHB bus clock. (The actual width time will be [clock period*(HI_WID+1)])
		NOTE: Value of this field can not be 0x0.
		Read/Write Enable Signal Low Pulse Width
[7:0]	LO_WID	This field controls the low pulse width of signals –RE and –WE while H/W mode page access is enabled. The pulse width is a multiple of period of AHB bus clock. (The actual width time will be [clock period*(LO_WID+1)])
		NOTE: Value of this field can not be 0x0.

NOTE1: The reset value is calculated base on 100MHz AHB Clock. Timing Effect of Above 3 Registers

Bits	Descriptions	
		NAND Flash ECC 1
		For 512+16 bytes/page models, this area contains a 3-byte ECC for page data from data byte 256 through byte 511.
		[23:16]: CP5 ~ CP0, 0x3
[23:0]	SMECC1	[15:8]: LP15 ~ LP08
		[7:0]: LP07 ~ LP00
		For 2048+64 bytes/page models, this area contains a 3-byte ECC for page data from data byte 512 through byte 1023.
		[23:16]: CP5 ~ CP0, LP17 ~ LP16
		[15:8]: LP15 ~ LP08
		[7:0]: LP07 ~ LP00

	RArea								

Bits	Descriptions	
		Redundant Area
[31:0]	RArea	This field keeps the 64 bytes data of redundant area for flash memory whose page size is 2K bytes.
		For 512+16 byte/page models, only the 16 bytes redundant area is required. (I.e. Those 16 bytes redundant data must be programmed into SMRA_0, SMRA_1, SMRA_2 and SMRA_3.)
		For 2048+64 byte/page models, the redundant data is programmed into SMRA_0 to SMRA_15.

Publication Release Date: Oct 01, 2008

NAND Flash ECC Correction Address 0 (SMECCAD0)

Register	Address	R/W	Description	Reset Value
SMECCAD0	0xB000_D10C	R	NAND Flash ECC Correction Address 0	0x0000_0000

31	30	29	28	27	26	25	24
F2_S	F2_STAT Reserved		F2_ADDR				
23	22	21	20	19	18	17	16
	F2_ADDR						
15	14	13	12	11	10	9	8
F1_S	F1_STAT Reserved		rved	F1_ADDR			
7	6	5	4	3	2	1	0
	F1_ADDR						

Bits	Descriptions				
		ECC Status of ECC-Field 2			
		This field contains the ECC correction status of ECC-field 2 (for page size 512+16B and 2048+64B).			
[31:30]	F2_STAT	 00 = No error. 01 = Correctable error. 10 = Uncorrectable error. 			
		 11 = ECC Code error (for 1-bit code error only). Error Location of Received Data (Field 2) 			
[27:16]	F2_ADDR	This field contains the error address result after ECC correct calculation. F2_ADDR [11:3] contains the byte address and F2_ADDR [2:0] contains the bit address of 256/512 bytes data.			
	F1_STAT	ECC Status of ECC-Field 1			
		This field contains the ECC correction status of ECC-field 1 (for page size 512+16B and 2048+64B).			
[15:14]		 00 = No error. 01 = Correctable error. 10 = Uncorrectable error. 11 = ECC Code error (for 1-bit code error only). 			
		Error Location of Received Data (Field 1)			
[11:0]	F1_ADDR	This field contains the error address result after ECC correct calculation. F1_ADDR [11:3] contains the byte address and F1_ADDR [2:0] contains the bit address of 256/512 bytes data. For example, if F1_ADDR = 0x01E, the error bit will be located at byte 3, bit 6. Software can correct the data by inverting that bit.			

NOTE: NAND Flash host provide 1-bit error correction and 2-bit error detection. If there are more than two data error bits, the status could be correctable or uncorrectable. And also, if there are two or more code error bits, the status could be uncorrectable or ECC code error.

Bits	Descriptions	
		Error Count of ECC-Field 4
[28:26] F4_ECNT	This field contains the error counts after ECC4 correct calculation. For this ECC4 core, it can correct up to 4 errors in a single field. Only when F4_STAT equals to $0x01$, the value in this field is meaningful. The value could be $0x1 \sim 0x4$; it means one error to four errors. The error address will be put at ECC4F4A1 and ECC4F4A2 .	
		ECC4 Status of ECC-Field 4
		This field contains the ECC4 correction status of ECC-field 4 (for page size 2048+64B).
[25:24]	F4_STAT	00 = No error.
		01 = Correctable error.
		10 = Uncorrectable error.
		Error Count of ECC-Field 3
[20:18]	F3_ECNT	This field contains the error counts after ECC4 correct calculation. For this ECC4 core, it can correct up to 4 errors in a single field. Only when ${\bf F3_STAT}$ equals to 0x01, the value in this field is meaningful. The value could be 0x1 \sim 0x4; it means one error to four errors. The error address will be put at ECC4F3A1 and ECC4F3A2.
		ECC4 Status of ECC-Field 3
		This field contains the ECC4 correction status of ECC-field 3 (for page size 2048+64B).
[17:16]	F3_STAT	00 = No error.
		01 = Correctable error.
		10 = Uncorrectable error.

7.11 LCD Display Interface Controller (LCM)

The main purpose of Display Controller is used to display the image data to LCD device or connect with external TV-encoder. The input data format of the display controller can be packet YUV422, packet RGB444, packet RGB565, and packet RGB666. The OSD (On Screen Display) function supports packet YUV422 and 8/16 direct-color mode. The LCD controller supports both sync-type and MPU-type LCD Module. This LCD Controller is a bus master and can transfer display data from system memory (SDRAM) without CPU intervention.

Features

- Input data format
 - ♦ YUV422, YUV444
 - ◆ RGB444, RGB565, RGB666
- Output format
 - ♦ YUV422, YUV444
 - ◆ RGB444, RGB565, RGB666
- Display size: Maximum size 1024x768
- Image resize
 - ♦ Horizontal up-scaling 1~8X in fractional steps
 - ◆ Vertical up-scaling 1~8X in fractional steps
- Convert RGB565, YUV422 display data to RGB444, RGB565, RGB666
- Convert full range YUV to CCIR601
- Windowing support for three OSD graphic or text overlay
- Support CCIR-656 (with header), CCIR-601(with hsync and vsync) 8/16-bit YUV data output format to connect with external TV encoder
- Support both sync-type and MPU-type LCM (with v-sync or not)
- Support the 8/9/16/18-bit data output to connect with 80/68 series MPU type LCM module
- Convert YUV422, YUV444, RGB565, YUV444, display data to RGB444, RGB565, RGB666, YUV422, YUV444

The LCD Controller includes the following main functions:

- Image post-processing
- Display & overlay control
- Image output control
- Hardware cursor control

Publication Release Date: Oct 01, 2008

Revision: A2

7.11.1 LCD Controller Function Description

7.11.1.1 VPOST Processor

The Display Engine is used to scale-up the image for display. The image can be arbitrarily up-scaled to full-screen size in horizontal and vertical direction by programming the scaling-factor registers *VA_SCALE*. Similarly, the OSD function also supports up-scaling in horizontal and vertical direction. But it only supports 2X and 4X up-scaling.

7.11.1.2 Display & Overlay Control

The Display Control unit includes timing controller and overlay controller. The timing controller generates the required horizontal and vertical timing for display device. The display timing is defined in the control registers, CRTC_SIZE~CRTC_VR and OSD_WINS~OSD_WINE. The following figure specifies the registers definition.

7.11.1.3 Digital Display Output Control

Various digital image output modes are supported:

- (1) 8-bit/16-bit YUV output for external TV-encoder;
- (2) 8-bit RGB output for sync-based TFT-LCD device;
- (3) 8-bit/16-bit/18-bit RGB output for high-color sync-based TFT-LCD device;
- (4) 8-bit/9-bit/16-bit/18-bit RGB output for MPU-interfaced LCD device.

The display device is defined in register <code>DEVICE_CTRL</code> [DEVICE]. The data bus 8-bit/16-bit or 9-bit/18-bit is selected by <code>DEVICE_CTRL</code> [DBWORD]. For the MPU-interfaced LCD, 68-series and 80-series MPU interface are supported. The display color formats can be 4096 (RGB444), 65536 (RGB565), and 262144 (RGB666) colors both in 8-bit and 16-bit or 9-bit and 18-bit data bus modes. The related control signals for MPU-interfaced LCD are defined in register <code>DEVICE_CTRL</code>. In addition, the image source color format can be YUV or RGB by setting register <code>DCCS</code> [VA_SRC].

Publication Release Date: Oct 01, 2008

Revision: A2

[18:17]	[LCD_ODD: SEL_ODD]	Control LCD Line Data Out 00 = First line data is RGB, second line data is GBR 01 = First line data is BGR, second line data is RBG 10 = First line data is GBR, second line data is RGB
		11 = First line data is RBG, second line data is BGR

[16]	YUV2CCIR	1 = Convert full range YUV to CCIR601 0 = No operation		
[15:8]	LCD_DDA	Generate LCD Clock Frequency for TFT-LCD Panel Note: Only for DEBICE_CTRL[DEVICE] "100" and "110" Set LCD_DDA = 0 will disable DDA operation.		
[7:5]	DEVICE	DEVICE Setting 000 = Packed YUV422 001 = Packed YUV444 100 = Sync-based TFT-LCD (UNIPAC) 101 = Sync-based TFT-LCD (SEIKO EPSON) 110 = Sync-based High-color TFT-LCD (RGB565/RGB666) 111 = MPU-Interfaced LCD (RGB332/RGB444/RGB565/RGB666)(default) Notes: 1. Device "000" is supported both in 8-bit and 16-bit data bus. 2. Device "110" is supported both in 16-bit and 18-bit. The 16-bit and 18-bit data bus is selected by DEVICE_CTRL [RGB_SCALE]. 3. Device "111" is supported in 8-bit, 9-bit, 16-bit, and 18-bit data bus. 4. The 8-bit/16-bit or 9-bit/18-bit data bus is selected by the combination of DEVICE_CTRL[DBWORD], DEVICE_CTRL[RGB_SCALE] and DEVICE_CTRL[DE_POL]		

Publication Release Date: Oct 01, 2008

Revision: A2

[4:3]	RGB_SHIFT/ DM_262K (Share bit)	RGB Data Output Shift for Sync-type LCD Panel When DEBICE_CTRL[DEVICE] = 100, 101 00 = Not Shift 01 = Shift One Cycle 10 = Shift 2 Cycle 11 = Not Defined RGB Data Output Arrangement for 262K MPU-Interface LCM When DEBICE_CTRL[DEVICE] = 111, and 16-bit data bus mode (*denote don't care bit) 00 = RRRRRRGGGGGGBBBB, ****************************
		ITU656 format select When DEVICE_CTRL[DEVICE] = 000, DCCS[ITU_EN]==1 and 8-bit data bus mode 01 = NTSC 10 = PAL

	CWAR Valor	YUV Data Output Swap (for Packed YUV mode) When DEVICE_CTRL[DEVICE] = 000
	SWAP_YcbCr (share_bit	00 = UYVY
[2-1]	DEVICE_CTRL[DEV ICE] = 000)	01 = YUYV
		10 = VYUY
		11 = YVYU

Publication Release Date: Oct 01, 2008

Revision: A2

[2]	SWAP_YcbCr[1](share_bit DEVICE_CTRL[DEV ICE] = 100)	Delay control: make the cycle of reading data from FIFO to be delay one cycles per two pixel so the output rate is 1.5 cycles per pixel .When DEVICE_CTRL[DEVICE] = 100, 8-bit data bus , DEVICE_CTRL [SWAP_YcbCr[0]] = 0, and DEVICE [DBWORD] = 1(Pixel data read from FIFO is 1 cycle per pixel), => Unipac sub-sampling one component from each RGB pixel 0 = 1/3 sub-sampling, per pixel is sub-sampling a component Seq: R0G1B2, R3G4B5 output 1 cycles per pixel For 960x240 panel, (source are expand from 320x240 to 960x240) 1= 1/2 sub-sampling, even pixel is sub sampled two components and odd pixel is sub sampled one components Seq: R0G0B1,R2G3B3,R4G4B5 output 1.5 cycles per pixel For 480x240 (source is 320x240)
[1]	SWAP_YcbCr[0](share_bit DEVICE_CTRL[DEV ICE] = 100)	Read cycles per pixel control: When DEVICE_CTRL[DEVICE] = 100, 8-bit data bus, DEVICE[DBWORD] = 0 , and DEVICE_CTRL [SWAP_YcbCr[1]] = 0, 0 = Pixel data read from FIFO is 2 cycles per pixel, Seq: R0G0B1,R1G2B2,R3G3B,4R4 2 cycles per pixel For 640 x240 panel (source 320x240) 1 = Pixel data read from FIFO is 3 cycles per pixel, Seq: R0G0B0,R1G1B1,R2G2B2,R3G3B3 3 cycles per pixel For 960x240 panel, (source is 320x240)
[2]	SWAP_YCbCr[1] (share_bit DEVICE_CTRL[DEV ICE] = 110)	RGB_Dumy format (for Sync-based High-color TFT-LCD -interfaced LCD) When DEVICE_CTRL[DEVICE] = 110, 8-bit data bus & 16M-color mode , DEVICE [DBWORD] = 0, SWAP_YCbCr[0] = x 0 = RGB - output 8bit data in the sequence of "R0G0B0R1G1B1", 3 cycles per pixel 1 = RGBX- output 8bit data in the sequence of "R0G0B0XR1G1B1X", 4 cycles per pixel
[1]	SWAP_YCbCr[0] (share_bit DEVICE_CTRL[DEV ICE] = 110)	RGB Data Output Swap (for 65536-color LCD & 262144-color LCD) When DEVICE_CTRL[DEVICE] = 110 , 8-bit data bus & 65536-color, 9-bit data bus & 256K-color mode and SWAP_YCbCr[1] = 0 0 = the high-byte of 16-bit RGB565 pixel data is output first, the low-byte data is output secondly; the msb 9-bit of 18-bit RGB666 pixel data is output first, the LSB 9-bit data is output secondly 1 = the low-byte of 16-bit RGB565 pixel data is output first, the low-byte data is output secondly; the LSB 9-bit of 18-bit RGB666 pixel data is output first, the msb 9-bit data is output secondly
[2]	SWAP_YCbCr[1] (share_bit DEVICE_CTRL[DEV ICE] = 111)	RGB Data Output Swap (for MPU-interfaced LCD) When DEVICE_CTRL[DEVICE] = 111 , 16-bit data bus & 4096-color mode 0 = Data format of DDATA[15:0] is {R,G,B,4'h0} in 4096-color mode 1 = Data format of DDATA[15:0] is {4'h0,R,G,B} in 4096-color mode

Publication Release Date: Oct 01, 2008

Revision: A2

[1]	SWAP_YCbCr[0] (share_bit	RGB Data Output Swap (for 65536-color LCD & 262144-color LCD) When DEVICE_CTRL[DEVICE] = 111 , 8-bit data bus & 65536-color, 9-bit data bus & 256K-color mode 0 = the high-byte of 16-bit RGB565 pixel data is output first, the low-byte data is output secondly; the msb 9-bit of 18-bit RGB666 pixel data
DEVICE_CTRL[DENICE] = 111)		is output first, the LSB 9-bit data is output secondly 1 = the low-byte of 16-bit RGB565 pixel data is output first, the low-byte data is output secondly; the LSB 9-bit of 18-bit RGB666 pixel data is output first, the msb 9-bit data is output secondly

MPU-Interfaced LCD Write Command Register (MPULCD_CMD)

When DEVICE = 111, a 16-bit value represents MPU-interfaced LCD command/parameter data. For 8-bit data bus or 16-bit data bus with 8-bit command mode, the MPULCD_CMD [15:8] is discarded. When writing data to this register (MPULCD_CMD[7:0]), Display Controller will switch to command mode and write this data to LCM if DCCS[CMD_ON] is enabled and Display Controller is not outputting display data. You can read DCCS [HACT] and DCCS [VACT] to get display status.

Register	Address	R/W	Description	Reset Value
MPULCD_CMD	0xB000_8008	R/W	MPU-Interface LCD Write Command	0x0000_0000

31	30	29	28	27	26	25	24
CMD_BUSY	WR_RS	READ			Reserved		
23	22	21	20	19	18	17	16
Reserved MPULCD_CMD[1						MD[17:16]	
15	14	13	12	11	10	9	8
	MPULCD_CMD[15:8]						
7	6	5	4	3	2	1	0
MPULCD_CMD[7:0]							

Bits	Descriptions	
[31]	CMD_BUSY	Command Interface is Busy 0 = Command interface is ready for next command 1 = Command interface is busy for writing/reading pending command
[30]	WR_RS	Write/Read RS Setting 0 = Output pin RS = 0 when sending command/parameter via MPULCD_CMD 1 = Output pin RS = 1 when sending command/parameter via MPULCD_CMD
[30]	READ	Read Status or Data 0 = Write command/parameter LCM 1 = Read status/data from LCM Note: Data will be stored in MPULCD_CMD[17:0], when CMD_BUSY is inactive after read operation
[17:16]	MPULCD_CMD	MPU-interfaced LCD read data (READ ONLY)
[15:0]	MPULCD_CMD	MPU-interfaced LCD command/parameter data, read data

Publication Release Date: Oct 01, 2008

Revision: A2

Interrupt Control/Status Register (INT_CS)

Interrupts are the communication method for Display Controller-initiated communication with the Display Controller Driver. There are several events that may trigger an interrupt from the Display Controller. Each specific event sets a specific bit in the *INT_CS* register. The Display Controller requests an interrupt when all three of the following conditions are met:

- The **DISP_INT_EN** bit in *DCCS* is set to `1'.
- A status bit in INT_CS is set to '1'.
- The corresponding enable bit in *INT_CS* for the *Status* bit is set to '1'.

Register	Address	R/W	Description	Reset Value
INT_CS	0xB000_800C	R/W	Interrupt Control/Status Register	0x0000_0000

31	30	29	28	27	26	25	24
DISP_F_INT	DISP_F_STATUS	UNDERRUN_INT	BUS_ERROR_INT			Reserved	
23	22	21	20	19	18	17	16
	Reserved						
15	14	13	12	11	10	9	8
			Reserved				
7	6	5	4	3	2	1	0
	Reserved					UNDERRUN_EN	DISP_F_EN

Bits	Descriptions	
[31]	DISP_F_INT	Frame Display Complete Interrupt Status, (Write-Clear) When write "1" value on the bit, the interrupt will be cleared. (This status bit can be internally written no matter DISP_F_EN is enable or not)
[30]	DISP_F_STATUS	Frame Display Complete Internal Status (2), (Write-Clear) When write "1" value on the bit, it will be cleared. (This status bit can be internally written only if DISP_F_EN is enable) Note: The interrupt status can be programmed for indicating frame displayed complete or field displayed complete by DCCS [FIELD_INTR].
[29]	UNDERRUN_INT	FIFO under-run Interrupt Status (Write-Clear) When write "1" value on the bit, the interrupt will be cleared.
[28]	BUS_ERROR_INT	Bus Error Interrupt (Write-Clear) When DMA bus master receive an error response from slaves, this bit will be set. When write "1" value on the bit, the interrupt will be cleared. Note: This interrupt is always enabled

Publication Release Date: Oct 01, 2008

Revision: A2

[1]	UNDERRUN_EN	FIFO under-run Interrupt Enable 0 = Disable 1 = Enable
[0]	DISP_F_EN	Frame Display Complete Interrupt Enable 0 = Disable 1 = Enable

Publication Release Date: Oct 01, 2008

Revision: A2

CRTC Display Size Register (CRTC_SIZE)

This register controls the display size. It includes Horizontal-Total (HTT) and Vertical-Total (VTT) registers. The value of HTT specifies the total number of pixels in the CRTC horizontal scan line interval including retrace time. And the value of VTT specifies the total number of scan line for each field (frame), including the retrace time.

Register	Address	R/W	Description	Reset Value
CRTC_SIZE	0xB000_8010	R/W	CRTC Display Size	0x0000_0000

Bits	Descriptions					
		Hsync signal adjustment for multi-cycles per pixel mode of Sync- based Unipac-LCD				
		When DEVICE_CTRL[DEVICE] = 100,8-bit data bus, DEVICE[DBWORD] = 0, and DEVICE_CTRL[SWAP_YcbCr[1]] = 0, If DEVICE_CTRL[SWAP_YcbCr[0]] = 0, it means that 2 cycles per pixel, so hsync's hrs would move three cycles if hrs added or subtracted 1.In order to adjust hsync signal in pclk unit, RGB_SHIFT shared register aids this function in -LCD with 8 bits data bus mode. HSYNC_SHIFT = 0 : hsync will not move HSYNC_SHIFT = 1 : hsync will left move 1 pclk cycle If DEVICE_CTRL[SWAP_YcbCr[0]] = 1, it means that 3 cycles per pixel, so hsync's hrs would move three cycles if hrs added or subtracted 1.In order to adjust hsync signal in pclk unit, RGB_SHIFT shared register aids this function in High-color TFT-LCD with 8 bits data bus mode. RGB_SHIFT = 0 : hsync will not move HSYNC_SHIFT = 1 : hsync will left move 1 pclk cycle HSYNC_SHIFT = 2 : hsync will left move 2 pclk cycle				
[31-30]	HSYNC_SHIFT [1:0]	Hsync signal adjustment for multi-cycles per pixel mode of Syncbased High-color TFT-LCD				
		When DEVICE_CTRL[DEVICE] = 110 , DEVICE_CTRL[RGB_SCALE]=3(16M-color mode) and DEVICE[DBWORD]= 0, If DEVICE_CTRL[SWAP_YcbCr[1]] = 0, it means that 3 cycles per pixel, so hsync's hrs would move three cycles if hrs added or subtracted 1.In order to adjust hsync signal in pclk unit, RGB_SHIFT shared register aids this function in High-color TFT-LCD with 8 bits data bus mode. HSYNC _SHIFT = 0 : hsync will not move HSYNC _SHIFT = 1 : hsync will left move 1 pclk cycle HSYNC _SHIFT = 2 : hsync will left move 2 pclk cycle If DEVICE_CTRL[SWAP_YcbCr[1]] = 1, it means that 4 cycles per pixel, so hsync's hrs would move three cycles if hrs added or subtracted 1.In order to adjust hsync signal in pclk unit, RGB_SHIFT shared register aids this function in High-color TFT-LCD with 8 bits data bus mode. HSYNC _SHIFT = 0 : hsync will not move HSYNC _SHIFT = 1 : hsync will left move 1 pclk cycle HSYNC _SHIFT = 2 : hsync will left move 2 pclk cycle HSYNC _SHIFT = 3 : hsync will left move 3 pclk cycle				
[26:16]	HSYNC_E[10:0]	CRTC Horizontal Sync End Timing An 11-bits value programmed in pixels, at which the Horizontal Sync Signal becomes inactive				
[10:0]	HSYNC_S[10:0]	CRTC Horizontal Sync Start Timing An 11-bits value programmed in pixels, at which the Horizontal Sync signal becomes active				

Publication Release Date: Oct 01, 2008

Revision: A2

CRTC Internal Vertical Retrace Timing Register (CRTC_VR)

The vertical retrace timing can be controlled by properly setting the values of starting (VRS) and ending (VRE) registers included in this register. The values are programmed in numbers of scan-line.

Register	Address	R/W	Description	Reset Value
CRTC_VR	0xB000_8020	R/W	CRTC Internal Vertical Retrace Timing	0x0000_0000

31	30	29	28	27	26	25	24

Image Stream Frame Buffer Control Register (VA_FBCTRL)

The information contained in this register is used to efficiently control the frame buffer operation. The VA_STRIDE shows the word offset of memory address between two vertically adjacent lines. The VA_FF specifies the number of WORD SDRAM access cycle for a horizontal scan line fetching. The data buffer FIFO is divided into two or four regions depending on the value of the IO_REGION_HALF. If IO_REGION_HALF is not asserted, there are four regions of 8 words each. If IO_REGION_HALF is asserted, there are two regions of 16 words each. The size of the region affects the AHB burst transfer size. There are two pointers into the FIFO: one for the display engine data and one for the AHB data. These pointers are maintained in the Data Buffer Control module. When the pointers are not in the same region, an AHB burst cycle is issued to read or write the data in the region pointed to by the AHB pointer.

Hardware Cursor Control Register (HC_CTRL)

Register	Address	R/W	Description	Reset Value
HC_CTRL	0xB000_806C	R/W	Hardware cursor control register	0x0000_0000

This register is used to control the modes of hardware cursor. (HC_TIP_X, HC_TIP_Y) specifies which the cursor's tip is located at on hardware cursor block.

31	30	29	28	27	26	25	24	
	Reserved

Bits	Descriptions	
[23:16]	HC_COLOR3_R	Hardware cursor color 3 R. When transparency is enabled, this color ram will be ignored.
[15:8] HC_COLOR3_G		Hardware cursor color 3 G. When transparency is enabled, this color ram will be ignored.
[7:0]	HC_COLOR3_B	Hardware cursor color 3 B. When transparency is enabled, this color ram will be ignored.

Publication Release Date: Oct 01, 2008

Revision: A2

7.12 Audio Controller

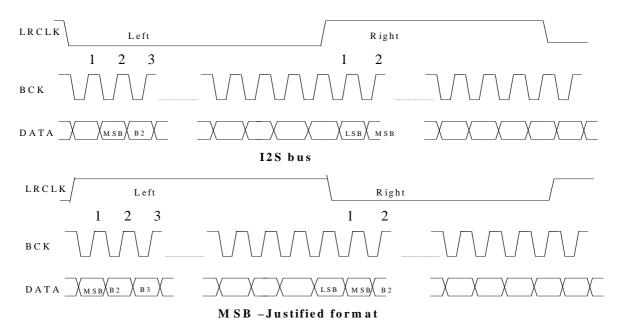

The audio controller consists of IIS/AC-link protocol to interface with external audio CODEC. One 8-level deep FIFO is for read path and write path, and each level has 32-bit width (16 bits for right channel and 16 bits for left channel). One DMA controller handles the data movement between FIFO and memory.

The following are the property of the DMA.

- Always 8-beat incrementing burst
- · Always bus lock when 8-beat incrementing burst
- When reach middle and end address of destination address, a DMA_IRQ is requested to CPU automatically

7.12.1 IIS Interface

The 16 bits IIS and MSB-justified format are supported; the timing diagram is shown the following.

The sampling rate, bit shift clock frequency could be set by the control register ACTL_IISCON.

Publication Release Date: Oct 01, 2008

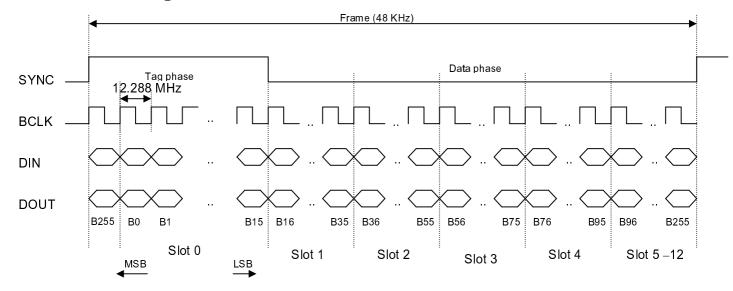

Revision: A2

7.12.2 AC97 Interface

The AC97 interface, called AC-link is supported. For input and output direction, each frame contains a Tag slot and 12 data slots. However, in the 12 data slots, only 4 slots are used in this chip, other 8 slots are not supported, and the control data and audio data are transferred in the 4 valid slots. Each slot contains 20 bits data.

AC97 Interface Signal Format

Publication Release Date: Oct 01, 2008

Revision: A2

Re	Reserved		R_DMA_IRQ	T_DMA_IRQ	Reserved		IIS_AC_PIN_SEL		
7	6	5	4	3	2	1	0		
FIFO_TH	_TH Reserved		IRQ_DMA_c ounter_EN	IRQ_DMA_D ATA_zero_EN	BLOCK_	_EN[1:0]	Reserved		

Bits	Descriptions				
[12]	R_DMA_IRQ	Recording DMA Interrupt Request Bit. When recording, when the DMA destination current address reach the DMA destination end address or middle address, the R_DMA_IRQ bit will be set to 1 automatically, and this bit could be cleared to 0 by CPU. The bit is hardwired to ARM as interrupt request signal with an inverter. The R_DMA_IRQ bit is read/write (write 1 to clear)			
[11]	T_DMA_IRQ	Transmit DMA Interrupt Request Bit. When DMA current address reach the middle address (((ACTL_DESE - ACTL_DESB)-1)/2 + ACTL_DESB) or reach the end address ACTL_DESB, the bit T_DMA_IRQ will be set to 1, and this bit could be clear to 0 by write "1" by CPU. And the bit is hardwired to ARM as interrupt request signal with an inverter. The T_DMA_IRQ bit is read/write (write 1 to clear).			
[8]	IIS_AC_PIN_SEL	IIS or AC-link Pin Selection If IIS_AC_PIN_SEL = 0, the pins select IIS If IIS_AC_PIN_SEL = 1, the pins select AC-link The IIS_AC_PIN_SEL bit is read/write			
[7]	FIFO_TH	FIFO Threshold Control Bit If FIFO_TH=0, the FIFO threshold is 8 level If FIFO_TH=1, the FIFO threshold is 4 level The FIFO_TH bit is read/write			

Publication Release Date: Oct 01, 2008

Revision: A2

		IRQ_DMA counter function enable Bit If IRQ_DMA_counter_EN=0, not allowed to generation T_DMA_IRQ			
[4]	IRQ_DMA_counter_EN	If IRQ_DMA_counter_EN =1, allowed to generation T_DMA_IRQ			
		The IRQ_DMA_counter_EN bit is read/write			
		IRQ_DMA_DATA zero and sign detect enable bit			
[3]	IRQ_DMA_DATA_zero_EN	If IRQ_DMA_DATA_zero_EN =0, not allowed to generation T_DMA_IRQ			
	IRQ_DMA_DATA_ZEIO_LN	If IRQ_DMA_DATA_zero_EN =1, allowed to generation T_DMA_IRQ			
		The IRQ_DMA_DATA_zero_EN bit is read/write			
		Audio Interface Type Selection If BLOCK_EN[0]=0/1, IIS interface is disable/enable			
[2:1]	BLOCK_EN[1:0]	If BLOCK_EN[1]=0/1, AC-link interface is disable/enable			
		The BLOCK_EN[1:0] bits are read/write			

Publication Release Date: Oct 01, 2008

Revision: A2

Sub-block Reset Control Register (ACTL_RESET)

The value of ACTL_RESET register controls the reset operation in each sub block.

		If PSR[3:0]=1110, reserved
		If PSR[3:0]=1111, IIS_SYSCLK=FPLL/16
		(when the division factor is $3/5/7$, the duty cycle of MCLK is not 50%, the high duration is $0.5*FPLL$)
		The PSR[3:0] bits are read/write

Publication Release Date: Oct 01, 2008

Revision: A2

		IIS Serial Data Clock Frequency Selection Bit If BCLK_SEL[1:0]=00, the frequency of bit clock (BCLK) is IIS_SYSCLK/8,					
[7:6]	BCLK_SEL	If BCLK_SEL [1:0] =01, the frequency of bit clock (BCLK) is IIS_SYSCLKK/12.					
		The BCLK_SEL[1:0] bits are re	ad/write			
[5]	FS_SEL	IIS Sampling Frequency Selection Bit If BCLK_SEL[1:0]=00, and FS_SEL=0, 32fs is selected, the sampling frequency (LRCLK) = IIS_SYSCLK/(8*32) = IIS_SYSCLK/(256) If BCLK_SEL[1:0]=00, and FS_SEL=1, 48fs is selected, the sampling frequency (LRCLK) = IIS_SYSCLK/(8*48) = IIS_SYSCLK/(384) If BCLK_SEL[1:0]=01, this bit is ignored, 32fs is selected, the sampling frequency (LRCLK) = IIS_SYSCLK/(12*32) = IIS_SYSCLK/(384) (fs is sampling rate) The FS_SEL bit is read/write Example: IIS_SYSCLK Sample Rate Sample Freq. BCLK_SEL FS_SEL 12.288MHz 32fs 48.0KHz 00 0 16.934MHz 32fs 44.1KHz 01 0					
[4]	MCLK_SEL	IIS_SYSCLK Output Selection Bit If MCLK_SEL=0, IIS_SYSCLK output will follow the PRS [3:0] setting. If MCLK_SEL=1, IIS_SYSCLK output will be the same with FPLL. The MCLK_SEL bit is read/write					
[3]	FORMAT	IIS Format Se If FORMAT=0	lection Bits , IIS compatible , MSB-justified	e format is selector

7	6	5	4	3	2	1	0			
RESERVED AC_BCLK_P U_EN		AC_R_FINI SH	AC_W_FINI SH	AC_W_RES	AC_C_RES	RESERVED				

Bits		Descriptions							
		AC_BCLK Pin Pull-high Resister Enable If AC_BCLK_PU_EN=0, the AC_BCLK pin pull-high resister will be disabled							
[5]	AC_BCLK_PU_EN	If AC_BCLK_PU_EN=1, the AC_BCLK pin pull-high resister will be enabled							
		The AC_BCLK_PU_EN bit is read/write.							
[4]	AC_R_FINISH	AC-link Read Data Ready Bit. When read data indexed by previous frame is shifted into ACTL_ACIS2, the AC_R_FINISH bit will be set to 1 automatically. After CPU read out the read data, AC_R_FINISH bit will be cleared to 0. If AC_R_FINISH=0, read data buffer has been read by CPU							
		If AC_R_FINISH=1, read data buffer is ready for CPU read							
		The AC_R_FINISH bit is read only							
[3]	AC_W_FINISH	AC-link Write Frame Finish Bit. When writing data to register ACTL_ACOSO, the AC_W_FINISH bit will be set to 1 automatically. After AC-link interface shift out the register ACTL_ACOSO, the AC_W_FINISH bit will be cleared to 0. If AC_W_FINISH=0, AC-link control data out buffer has been shifted out to codec by CPU and data out buffer is empty.							
		<pre>If AC_W_FINISH=1, AC-link control data out buffer is ready to be shifted out(After users have wrote data into register ACTL_ACOS0)</pre>							
		The AC_W_FINISH bit is read only							

Publication Release Date: Oct 01, 2008

Revision: A2

[2]	AC_W_RES	AC-link Warm Reset Control Bit When this bit is set to 1, (AC-link begin warn reset procedure, after warn reset procedure finished, this bit will be cleared automatically) the interface signal AC_SYNC is high, when this bit is set to 0, the interface signal AC_SYNC is controlled by AC_BCLK input when this bit is set to 1. Note the AC-link spec. shows it need at least 10 us high duration of AC_SYNC to warn reset AC97. If AC_W_RES=0, AC_SYNC pin is controlled by AC_BCLK input pin If AC_W_RES=1, AC_SYNC pin is forced to high The AC_W_RES bit is read/write
[1]	AC_C_RES	AC-link Cold Reset Control Bit When this bit is set to 1, the interface signal AC_RESETB is low, when this bit is set to 0, the signal AC_RESETB is high. Note the AC-link spec. shows it need at least 10 us low duration of AC_RESETB to cold reset AC97. If AC_C_RES=0, AC_RESETB pin is set to 1 If AC_C_RES=1, AC_RESETB pin is set to 0 The AC_C_RES bit is read/write

Publication Release Date: Oct 01, 2008

Revision: A2

AC-link output slot 0 (ACTL_ACOS0)

The ACTL_ACOS0 register store the slot 0 value to be shift out by AC-link. Note that write data to ACTL_ACOS0 register when AC_W_FINISH bit (ACTL_ACCON [3]) set is invalid. Therefore, check AC_W_FINISH bit status before write data into ACTL_ACOS0 register.

7.13 2-D Graphic Engine

A 32-bit 2D Graphics Engine (2D GE) is specially designed to improve the performance of graphic processing. It can accelerate the operation of individual GUI functions such as BitBLTs and Bresenham Line Draw to operate at all pixel depths including 8/16/32 bit-per-pixel. A pixel is the smallest addressable screen element as defined in Microsoft Windows, and lines and pictures are made up by a variety of pixels. 2D GE is used to speed up graphic performance in pixel data moving and line drawing, as well as to accelerate almost all computer graphic Boolean operations by eliminating the CPU overhead. Meanwhile, the functions of rotation and scaling down are implemented for some special applications. In image scaling down function, both programmable horizontal and vertical N/M scaling down factors are provided for resizing the image. For the 2D rotation, it can rotate left or right 45, 90 or 180 degrees, and also supports the flip/flop, mirror or up-side-down pictures.

Graphic Engine Destination Start XY/Linear Register

Register	Address	R/W	Description	Reset Value
2D_GEDSXY	0xB000_B040	R/W	Graphic Engine Destination Start X/Y addressing (pixel)	0x0000_0000
2D_GEDSL	0xB000_B040	R/W	Graphic Engine Destination Start Linear address (byte)	0x0000_0000
(A)				

(A)

31	30	29	28	27	26	25	24			
Destination Start Y [10:8]										
23	22	21	20	19	18	17	16			
	Destination Start Y [7:0]									
15	14	13	12	11	10	9	8			
Destination Start X [10:8]										
7	7 6 5 4 3 2 1 0									
	Destination Start X [7:0]									

Bits	Descriptions	
[26:16]	Destination Start Y	11-bit Destination Start Y For BitBLTs and Bresenham line draw in X/Y addressing, this register specifies the destination start Y in pixels.
[10:0]	Destination Start X	11-bit Destination Start X For BitBLTs and Bresenham line draw in X/Y addressing, this register specifies the destination start X in pixels.

(B)

31	30	29	28	27	26	25	24			
Destination Linear Start Address [27:24]										
23 22 21 20 19 18 17 16										
		Destination	Linear Start	Address [23:16]					
15	15 14 13 12 11 10 9 8									
	Destination Linear Start Address [15:8]									
7	7 6 5 4 3 2 1 0									
	Destination Linear Start Address [7:0]									

Bits	Descriptions				
[27:0]	Destination Linear Starting Address	28-bit Destination Linear Starting Address For BitBLTs in linear addressing mode, this register specifies the destination linear starting address in bytes.			

Publication Release Date: Oct 01, 2008

Revision: A2

Graphic Engine Dimension for XY/Linear Modes Register

Register	egister Address R/W Description		Reset Value	
2D_GEDIXYL	0xB000_B044		Graphic Engine Dimension in XY (pixel) or linear (byte)	0x0000_0000

Bits	Descriptions	
[26:16]	Dimension Y	11-bit Dimension Y For BitBLTs, this register specifies the height of rectangle in X/Y addressing (by pixel) or in linear addressing (by byte).
[10:0]	Dimension X	11-bit Dimension X For BitBLTs, this register specifies the width of rectangle in X/Y addressing (by pixel) or in linear addressing (by byte).

Graphic Engine Clipping Boundary Top/Left Register

Register	Address	R/W	Description	Reset Value
2D_GECBTL	0xB000_B048		Graphic Engine Clipping Boundary Top/Left (by X/Y pixel)	0x0000_0000

31	30	29	28	27	26	25	24			
	Clipping Boundary Top [10:8]									
23	22	21	20	19	18	17	16			
	Clipping Boundary Top [7:0]									
15	14	13	12	11	10	9	8			
		Clippir	ng Boundary	Left [10:8]					
7	6	5	4	3	2	1	0			
	Clipping Boundary Left [7:0]									

Bits	Descriptions	
[26:16]	Clipping Boundary Top	11-bit Clipping Boundary Top This register specifies the top of the clipping rectangle.
[10:0]	Clipping Boundary Left	11-bit Clipping Boundary Left This register specifies the left limit of the clipping rectangle.

Publication Release Date: Oct 01, 2008

Revision: A2

Graphic Engine Clipping Boundary Bottom/Right Register

Register	Address	R/W I	Description			Reset Value			
2D_GECBBR	0xB000_B0		Graphic Engine Clipping Boundary Bottom/Right (pixel)			0x0000_0000			
31	30	29	28	27	26	2	5	24	
	Clipping Boundary Bottom [10:8]								
23	22	21	20	19	18	17	7	16	
		Clippii	ng Boundary l	Bottom [7:0)]				
15	14	13	12	11	10	9	١	8	
	Clipping Boundary Right [10:8]								
7	6	5	4	3	2	1		0	
		Clipp	ing Boundary	Right [7:0]]				

Bits	Descriptions	
[26:16]	Clipping Boundary Bottom	11-bit Clipping Boundary Bottom This register specifies the bottom of the clipping rectangle.
[10:0]	Clipping Boundary Right	11-bit Clipping Boundary Right This register specifies the right limit of the clipping rectangle.

Publication Release Date: Oct 01, 2008

Revision: A2

Graphic Engine Pattern Group A Register

Register	Address	R/W	Description	Reset Value
2D_GEPTNA	0xB000_B050	R/W	Graphic Engine Pattern Group A	0x0000_0000

31	30	29	28	27	26	25	24		
			Pattern:	3					
23	22	21	20	19	18	17	16		
			Pattern	2					
15	14	13	12	11	10	9	8		
			Pattern	1					
7	6	5	4	3	2	1	0		
	Pattern0								

Bits	Descriptions	
		Bits 31-24 Pattern 3 Register
		When pattern is monochrome, this is the 4th line of the 8×8 pattern.
		Bits 23-16 Pattern 2 Register
[21.0]		When pattern is monochrome, this is the 3rd line of the 8×8 pattern.
[31:0]	Pattern Group A	Bits 15-8 Pattern 1 Register
		When pattern is monochrome, this is the 2nd line of the 8×8 pattern.
		Bits 7-0 Pattern 0 Register
		When pattern is monochrome, this is the 1st line of the 8×8 pattern.

Publication Release Date: Oct 01, 2008

Revision: A2

Graphic Engine Pattern Group B Register

Register	Address	R/W	Description	Reset Value
2D_GEPTNB	0xB000_B054	R/W	Graphic Engine Pattern Group B	0x0000_0000

31	30	29	28	27	26	25	24

	Write Plane Mask [15:8]									
7	6	5	4	3	2	1	0			
		Wr	ite Plane Ma	sk [7:0]	•					

Write Plane Mask [7:0]

Bits	Descriptions	
[23:0]	Write Plane Mask	24-bit Write Plane Mask These bits specify which bits within each pixel are subject to update by the Graphics Engine. A one enable writing to the corresponding bit plane and a 0 inhibits writing to the corresponding bit plane. Only the corresponding number of bits-per-pixel in the display mode is required in the register.

Publication Release Date: Oct 01, 2008

Revision: A2

Graphic Engine Miscellaneous Control Register

Register	Address	R/W	Description	Reset Value
2D_GEMC	0xB000_B05C	R/W	Graphic Engine Miscellaneous Control	0x0000_0000

31	30	29	28	27	26	25	24		
	LINE STYLE PATTERN 1/ Alpha Blending Source Ks

Bits	Descriptions	
[31:16]	Line Style Pattern1 Line Style Pattern0	Bits 31-16 16-bit line style pattern for Bresenham line drawing.
[31:16]	Alpha Blending Ks and Kd	Bits 31-24 Bits 23-16 8-bit alpha blending factor Ks for source data and 8-bit alpha blending factor Kd for destination data.
[15:12]	FIFO Status	GE FIFO counter status $0000 \sim 0111 = \text{FIFO current level}$ $0000 = \text{empty and } 1000 = \text{full}$
[11]	ЕМРТҮ	FIFO empty status 0 = Not empty 1 = Empty
[10]	FULL	FIFO full status 0 = Not full 1 = Full
[9]	BitBLT_STS	GE BitBLT operation complete status 0 = No complete status occur 1 = BitBLT operation complete status occur

Publication Release Date: Oct 01, 2008

Revision: A2

[8]	BUSY	GE Operation status 0 = Ready, No GE operation 1 = Busy, GE operation is still under working
[7]	RST_GE2D	Bit 7 1 = Reset GE2D.
[6]	RST_FIFO	Bit 6 1 = Reset FIFO.
[5:4]	Bit Per Pixel	Bits 5-4 Graphics Engine Pixel Depth 00 = 8-bit 01 = 16-bit 10 = 32-bit 11 = reserved
[3]	BLT_MODE	0 = BitBLT type is according to GEC control bits 1 = BitBLT type follows BLT_TYPE[2:0] setting as below
[2:0]	BLT_TYPE	Bits 2-0 BitBLT Type Setting 000 = HostBLT (write mode) 001 = HostBLT (read mode) 010 = SolidFillBLT 011 = PatternBLT 100 = BlockMoveBLT 101 = Color/Font Expansion BLT 110 = Monochrome Transparent BLT 111 = Color Transparent BLT

Publication Release Date: Oct 01, 2008

Revision: A2

7.14 UART Controller

The Universal Asynchronous Receiver/Transmitter (UART) performs a serial-to-parallel conversion on data characters received from the peripheral, and a parallel-to-serial conversion on data characters received from the CPU. There are three UART blocks and accessory logic in this chip.

7.14.1 UART Feature Description

7.14.1.1 UARTO

UARTO is a general UART block without Modem I/O signals.

UARTO	
Clock Source	External Crystal
UART Type	General UART
FIFO Number	16-byte receiving FIFO and 16 byte transmitting FIFO
Modem Function	None
Accessory Function	None
I/O pin	TXD0, RXD0

7.14.1.2 UART1

UART1 is a high speed UART. The FIFO has 64-byte for receiving and 64-byte for transmitting. The clock source is programmable in chip clock generator.

aree is programmable in emp clock generator.						
UART1						
Clock Source	External Crystal or internal PLL (Programmable)					
UART Type	High speed UART					
FIFO Number	64-byte receiving FIFO and 64 byte transmitting FIFO					
Modem Function	None					
Accessory Function	None					
I/O pin	TXD1, RXD1					

7.14.1.3 UART2

UART2 is a general UART with IrDA SIR.

UART2	
Clock Source	External Crystal
UART Type	General UART
FIFO Number	16-byte receiving FIFO and 16 byte transmitting FIFO
Modem Function	none
Accessory Function	IrDA SIR
I/O pin	TXD2, RXD2

Publication Release Date: Oct 01, 2008

Revision: A2

7.14.2 UART Control Registers Map

R: read only, W: write only, R/W: both read and write, C: Only value 0 can be written

Receive Buffer Register (RBR)

Register	Offset	R/W	Description	Reset Value
RBR	0XB800_0x00	R	Receive Buffer Register (DLAB = 0)	Undefined

7	6	5	4	3	2	1	0	
8-bit Received Data								

Bits	Descriptions					
[7:0]	8-bit Receive d Data	By reading this register, the UART will return an 8-bit data received from SIN pin (LSB first).				

Transmit Holding Register (THR)

Register	offset	R/W	Description	Reset Value	
THR	0XB800_0x00	W	Transmit Holding Register (DLAB = 0)	Undefined	

7	6	5	4	3	2	1	0
8-bit Transmitted Data							

Bits	Descriptions						
[7:0]	8-bit Transmitted Data	By writing to this register, the UART will send out an 8-bit data through the SOUT pin (LSB first).					

Publication Release Date: Oct 01, 2008

Revision: A2

Interrupt Enable Register (IER)

Register	offset	R/W	Description	Reset Value	
IER	0XB800_0x04 R/		Interrupt Enable Register (DLAB = 0)	0x0000.0000	

7	6	5	4	3	2	1	0
RESERVED			MSIE	RLSIE	THREIE	RDAIE	

Bits	Descriptions					
[3]	MSIE	MODEM Status Interrupt (Irpt_MOS) Enable ■ 0 = Mask off Irpt_MOS ■ 1 = Enable Irpt_MOS				
[2]	RLSIE	Receive Line Status Interrupt (Irpt_RLS) Enable • 0 = Mask off Irpt_RLS • 1 = Enable Irpt_RLS				
[1]	THREIE	Transmit Holding Register Empty Interrupt (Irpt_THRE) Enable • 0 = Mask off Irpt_THRE • 1 = Enable Irpt_THRE				
[0]	RDAIE	Receive Data Available Interrupt (Irpt_RDA) Enable and Time-out Interrupt (Irpt_TOUT) Enable • 0 = Mask off Irpt_RDA and Irpt_TOUT • 1 = Enable Irpt_RDA and Irpt_TOUT				

Publication Release Date: Oct 01, 2008

Revision: A2

Divider Latch (Low Byte) Register (DLL)

Register	Offset	R/W	Description	Reset Value
DLL	0XB800_0x00	R/W	Divisor Latch Register (LS) (DLAB = 1)	0x0000_0000

7	6	5	4	3	2	1	0
		Ва	ud Rate Divi	der (Low By	te)		

Bits		Descriptions
[7:0]	Baud Rate Divisor (Low Byte)	The low byte of the baud rate divider

Divisor Latch (High Byte) Register (DLM)

Register	Offset	R/W	Description	Reset Value
DLM	0XB800_0x04	R/W	Divisor Latch Register (MS) (DLAB = 1)	0x0000_0000

7	6	5	4	3	2	1	0		
	Baud Rate Divider (High Byte)								

Bits	Descriptions	
[7:0]	Baud Rate Divisor (High Byte)	The high byte of the baud rate divider

This 16-bit divider {DLM, DLL} is used to determine the baud rate as follows

Baud Rate = Crystal Clock / {16 * [Divisor + 2]}

Note: This definition is different from 16550

Publication Release Date: Oct 01, 2008

Revision: A2

Interrupt Identification Register (IIR)

Register	Offset	R/W	Description	Reset Value
IIR	0XB800_0x08	R	Interrupt Identification Register	0x8181_8181

7	6	5	4	3	2	1	0
FMES	DE	ΓLS	DMS	IID			NIP

Bits	Description	scriptions					
		FIFO Mode Enable Status					
[7]	[7] FMES	This bit indicates whether the FIFO mode is enabled or not. Since the FIFO mode is always enabled, this bit always shows the logical 1 when CPU is reading this register.					
		Rx FIFO Threshold Level Status					
[6:5]	RFTLS	These bits show the current setting of receiver FIFO threshold level (RTHO). The meaning of RTHO is defined in the following FCR description.					
		DMA Mode Select					
[4]	DMS	The DMA function is not implemented in this version. When reading IIR, the DMS is always returned 0.					
[3:1]	IID	Interrupt Identification					
[3.1]	110	The IID together with NIP indicates the current interrupt request from UART.					
[0]	NTD	No Interrupt Pending					
[0]	NIP	There is no pending interrupt.					

Publication Release Date: Oct 01, 2008

Revision: A2

Interrupt Control Functions

IIR [3:0]	Priority	Interrupt Type Interrupt Source		Interrupt Reset control
1		None	None	
0110	Highest	Receiver Line Status (Irpt_RLS)	Overrun error, parity error, framing error, or break interrupt	Reading the LSR
0100	Second	Received Data Available (Irpt_RDA)	Receiver FIFO threshold level is reached	Receiver FIFO drops below the threshold level
1100	Second	Receiver FIFO Time- out (Irpt_TOUT)	Receiver FIFO is non- empty and no activities are occurred in the receiver FIFO during the TOR defined time duration	Reading the RBR
0010	Third	Transmitter Holing Register Empty (Irpt_THRE)	Transmitter holding register empty	Reading the IIR (if source of interrupt is Irpt_THRE) or writing into the THR
0000	Fourth	MODEM Status (Irpt_MOS)	The CTS bits are changing state.	Reading the MSR (optional)

Note: These definitions of bit 7, bit 6, bit 5, and bit 4 are different from the 16550.

Publication Release Date: Oct 01, 2008

Revision: A2

FIFO Control Register (FCR)

Register	Offset	R/W	Description	Reset Value
FCR	0XB800_0x08	W	FIFO Control Register	Undefined

7	6	5	4	3	2	1	0
	RFITL				TFR	RFR	FME

Bits	Descripti	ons									
		Rx FIFO	Rx FIFO Interrupt (Irpt_RDA) Trigger Level								
			RFITL [7:4]	Trigger Level			RFITL[7:4]	Trigger Level			
		UART0	00xx	01 bytes			0000	01 bytes			
		UART2	01xx	04 bytes			0001	04 bytes			
[7:4]	RFITL		10xx	08 bytes			0010	08 bytes			
			11xx	14 bytes		UART1	0011	14 bytes			
				,			0100	30 bytes			
							0101	46 bytes			
							others	62 bytes			
[3]	DMS		DMA Mode Select The DMA function is not implemented in this version.								
		Tx FIFO Reset									
[2]	TFR	becomes	Setting this bit will generate an OSC cycle reset pulse to reset Tx FIFO. The Tx FIFO becomes empty (Tx pointer is reset to 0) after such reset. This bit is returned to 0 automatically after the reset pulse is generated.								
		Rx FIFO Reset									
[1]	RFR	becomes	Setting this bit will generate an OSC cycle reset pulse to reset Rx FIFO. The Rx FIFO becomes empty (Rx pointer is reset to 0) after such reset. This bit is returned to 0 automatically after the reset pulse is generated.								
		FIFO Mo	FIFO Mode Enable								
[0]	Because UART is always operating in the FIFO mode, writing this bit has while reading always gets logical one. This bit must be 1 when other FCF written to; otherwise, they will not be programmed.										

Publication Release Date: Oct 01, 2008

Revision: A2

Line Control Register (LCR)

Register	offset	R/W	Description	Reset Value
LCR	0XB800_0x0C	R/W	Line Control Register	0x0000_0000

7	6	5	4	3	2	1	0
DLAB	ВСВ	SPE	EPE	PBE	NSB	WLS	

Bits	Descriptions					
		Divider Latch Access Bit				
[7]	DLAB	0 = It is used to access RBR, THR or IER.				
		$1 = \text{It is used to access Divisor Latch Registers {DLL, DLM}}.$				
		Break Control Bit				
[6]	ВСВ	When this bit is set to logic 1, the serial data output (SOUT) is forced to the Spacing State (logic 0). This bit acts only on SOUT and has no effect on the transmitter logic.				
		Stick Parity Enable				
	SPE	0 = Disable stick parity				
[5]		1 = Parity bit is transmitted and checked as a logic 1 if bit 4 is 0 (odd parity), or as a logic 0 if bit 4 is 1 (even parity). This bit has effect only when bit 3 (parity bit enable) is set.				
		Even Parity Enable				
[4]	EPE	0 = Odd number of logic 1's are transmitted or checked in the data word and parity bits.				
[4]		1 = Even number of logic 1's are transmitted or checked in the data word and parity bits.				
		This bit has effect only when bit 3 (parity bit enable) is set.				

Publication Release Date: Oct 01, 2008

Revision: A2

		Parity Bit Enable						
[3]	PBE	0 = Parity bit is transfer.	0 = Parity bit is not generated (transmit data) or checked (receive data) during transfer.					
			1 = Parity bit is generated or checked between the "last data word bit" and "stop bit" of the serial data.					
		Number of "STOP	P bit"					
		0= One " STOP b	oit" is generated in the	transmitted data				
[2]	NSB	1= One and a half "STOP bit" is generated in the transmitted data when 5-length is selected;						
		Two "STOP bit" is	Two "STOP bit" is generated when 6-, 7- and 8-bit word length is selected.					
		Word Length Sele	ect					
		WLS[1:0]	Character length					
[1:0]	WLS	00	5 bits					
		01	6 bits					
		10	7 bits	1

Line Status Control Register (LSR)

Register	Offset	R/W	Description	Reset Value
LSR	0XB800_0x14	R	Line Status Register	0x6060_6060

7	6	5	4	3	2	1	0
ERR_Rx	TE	THRE	BII	FEI	PEI	OEI	RFDR

Bits	Description	ons
		Rx FIFO Error 0 = Rx FIFO works normally
[7]	ERR_Rx	1 = There is at least one parity error (PE), framing error (FE), or break indication (BI) in the FIFO. ERR_Rx is cleared when CPU reads the LSR and if there are no subsequent errors in the Rx FIFO.
		Transmitter Empty
[6]	TE	0 = Either Transmitter Holding Register (THR - Tx FIFO) or Transmitter Shift Register (TSR) are not empty.
		1 = Both THR and TSR are empty.
		Transmitter Holding Register Empty
		0 = THR is not empty.
[5]	THRE	1 = THR is empty.
		THRE is set when the last data word of Tx FIFO is transferred to Transmitter Shift Register (TSR). The CPU resets this bit when the THR (or Tx FIFO) is loaded. This bit also causes the UART to issue an interrupt (Irpt_THRE) to the CPU when IER $[1] = 1$.
		Break Interrupt Indicator
[4]	віі	This bit is set to a logic 1 whenever the received data input is held in the "spacing state" (logic 0) for longer than a full word transmission time (that is, the total time of "start bit" + data bits + parity + stop bits) and is reset whenever the CPU reads the contents of the LSR.

Publication Release Date: Oct 01, 2008

Revision: A2

		Framing Error Indicator
[3]	FEI	This bit is set to logic 1 whenever the received character does not have a valid "stop bit" (that is, the stop bit following the last data bit or parity bit is detected as a logic 0), and is reset whenever the CPU reads the contents of the LSR.
		Parity Error Indicator
[2]	PEI	This bit is set to logic 1 whenever the received character does not have a valid "parity bit", and is reset whenever the CPU reads the contents of the LSR.
		Overrun Error Indicator
[1]	OEI	An overrun error will occur only after the Rx FIFO is full and the next character has been completely received in the shift register. The character in the shift register is overwritten, but it is not transferred to the Rx FIFO. OE is indicated to the CPU as soon as it happens and is reset whenever the CPU reads the contents of the LSR.
		Rx FIFO Data Ready
[0]	RFDR	0 = Rx FIFO is empty
		1 = Rx FIFO contains at least 1 received data word.

LSR [4:2] (BII, FEI, PEI) are revealed to the CPU when its associated character is at the top of the Rx FIFO. These three error indicators are reset whenever the CPU reads the contents of the LSR.

LSR [4:1] (BII, FEI, PEI, OEI) are the error conditions that produce a "receiver line status interrupt" (Irpt_RLS) when IER [2] =1. Reading LSR clears Irpt_RLS. Writing LSR is a null operation (not suggested).

Time-Out Register (TOR)

Register	offset	R/W	Description	Reset Value
TOR	0XB800_0x1C	R/W	Time Out Register	0x0000_0000

7	6	5	4	3	2	1	0
TOIE				TOIC			

Bits		Descriptions					
[7]	TOIE	Time Out Interrupt Enable The feature of receiver time out interrupt is enabled only when TOR [7] = IER [0] = 1.					
[6:0]	тоіс	Time Out Interrupt Comparator The time out counter resets and starts counting (the counting clock = baud rate) whenever the Rx FIFO receives a new data word. Once the content of time out counter (TOUT_CNT) is equal to that of time out interrupt comparator (TOIC), a receiver time out interrupt (Irpt_TOUT) is generated if TOR [7] = IER [0] = 1. A new incoming data word or Rx FIFO empty clears Irpt_TOUT.

7.15 TIMER Controller

7.15.1 General Timer Controller

The timer module includes five channels, TIMER0~TIMER4, they can easily be implemented as counting scheme. The timer can perform functions like frequency measurement, event counting, interval measurement, pulse generation, delay timing, and so on. The timer possesses features such as adjustable resolution, programmable counting period, and detailed information. The timer can generate an interrupt signal upon timeout, or provide the current value of count during operation.

The general TIMER Controller includes the following features

- Five channels with a 24-bit down counter and an interrupt request each
- Independent clock source for each channel
- Maximum uninterrupted time = (1 / 15 MHz) * (255) * (2^24 1), if TCLK = 15 MHz

7.15.2 Watchdog Timer

The purpose of watchdog timer is to perform a system restart after the software running into a problem. This prevents system from hanging for an indefinite period of time. It is a free running timer with programmable time-out intervals. When the specified time internal expires, a system reset can be generated. If the watchdog timer reset function is enabled and the watchdog timer is not being reset before timing out, then the watchdog reset is activated after 1024 WDT clocks. Setting **WTE** in the register **WTCR** enables the watchdog timer.

The **WTR** should be set before making use of watchdog timer. This ensures that the watchdog timer restarts from a know state. The watchdog timer will start counting and time-out after a specified period of time. The time-out interval is selected by two bits, **WTIS** [1:0]. The **WTR** is self-clearing, i.e., after setting it, the hardware will automatically reset it. When timeout occurs, Watchdog Timer interrupt flag is set. Watchdog Timer waits for an additional **1024 WDT clock cycles** before issuing a reset signal, if the **WTRE** is set. The **WTRF** will be set and the reset signal will last for **15 WDT clock cycles** long. When used as a simple timer, the interrupt and reset functions are disabled. Watchdog Timer will set the **WTIF** each time a timeout occurs. The **WTIF** can be polled to check the status, and software can restart the timer by setting the **WTR**.

Revision: A2

7.16 Advanced Interrupt Controller

An *interrupt* temporarily changes the sequence of program execution to react to a particular event such as power failure, watchdog timer timeout, transmit/receive request from Ethernet MAC Controller, and so on. The CPU processor provides two modes of interrupt, the **Fast Interrupt (FIQ)** mode for critical session and the *Interrupt* (**IRQ**) mode for general purpose. The IRQ request is occurred when the nIRQ input is asserted. Similarly, the FIQ request is occurred when the nFIQ input is asserted. The FIQ has privilege over the IRQ and can preempt an ongoing IRQ. It is possible to ignore the FIQ and the IRQ by setting the F and I bits in the **current program status register (CPSR)**.

The **Advanced Interrupt Controller (AIC)** is capable of processing the interrupt requests up to 32 different sources. Currently, 23 interrupt sources are defined. Each interrupt source is uniquely assigned to an *interrupt channel*. For example, the watchdog timer interrupt is assigned to channel 1. The AIC implements a proprietary eight-level priority scheme that categories the available 23 interrupt sources into eight priority levels. Interrupt sources within the priority level 0 is the highest priority and the priority level 7 is the lowest. In order to make this scheme work properly, a certain priority level must be specified to each interrupt source during power-on initialization; otherwise, the system shall behave unexpectedly. Within each priority level, interrupt source that is positioned in a lower channel has a higher priority. Interrupt source that is active, enabled, and positioned in the lowest channel with priority level 0 is promoted to the FIQ. Interrupt sources within the priority levels other than 0 are routed to the IRQ. The IRQ can be preempted by the occurrence of the FIQ. Interrupt nesting is performed automatically by the AIC.

Though interrupt sources originated from the chip itself are intrinsically high-level sensitive, the AIC can be configured as either low-level sensitive, high-level sensitive, negative-edge triggered, or positive-edge triggered to each interrupt source.

The advanced interrupt controller includes the following features:

- External interrupts can be programmed as either edge-triggered or level-sensitive
- External interrupts can be programmed as either low-active or high-active
- Flags to reflect the status of each interrupt source
- Individual mask for each interrupt source
- Proprietary 8-level interrupt scheme to employ the priority scheme.
- Priority methodology is adopted to allow for interrupt daisy-chaining
- Automatically masking out the lower priority interrupt during interrupt nesting
- Automatically clearing the interrupt flag when the external interrupt source is programmed to be edgetriggered

Bits	Descriptions						
		Interrupt Source Type Whether an interrupt source is considered active or not by the AIC is subject to the settings of this field. Interrupt sources should be configured as lessensitive during normal operation unless in the testing situation.					
[7:6]	SRCTYPE	SRCTYPI	E [7:6]	Interrupt Source Type			
[7.0]	SKETTI	0	0	Low-level Sensitive			
		0	1	High-level Sensitive			
		1	0	Negative-edge Triggered			
		1	1	Positive-edge Triggered			
[2:0]	PRIORITY	Priority Level Every interrupt source must be assigned a priority level during initiation. Among them, priority level 0 has the highest priority and priority level 7 the lowest. Interrupt sources with priority level 0 are promoted to FIQ. Interrupt sources with priority level other than 0 belong to IRQ. For interrupt sources of the same priority level, which located in the lower channel number has higher priority.

Publication Release Date: Oct 01, 2008

Revision: A2

AIC IRQ Priority Encoding Register (AIC_IPER)

When the AIC generates the interrupt, **VECTOR** represents the interrupt channel number that is active, enabled, and has the highest priority. If the representing interrupt channel possesses a priority level 0, then the interrupt asserted is FIQ; otherwise, it is IRQ. The value of **VECTOR** is copied to the register AIC_ISNR thereafter by the AIC. *This register was restored a value 0 after it was read by the interrupt handler*. This register can help indexing into a branch table to quickly jump to the corresponding interrupt service routine.

7.17 General-Purpose Input/Output (GPIO)

7.17.1 Overview

The General-Purpose Input/Output (**GPIO**) module possesses 54 pins, and serves as multiple function purposes. Each port can be easily configured by software to meet various system configurations and design requirements. Software must define which function of each pin is used before starting the main program. If a pin is not used for multiplexed functions, the pin can be configured as I/O ports.

These 52 IO pins are divided into 6 groups according to its peripheral interface definition.

PortC: 15-pin input/output port

PortD: 8-pin input/output port

PortE: 7-pin input/output port

PortF: 10-pin input/output port

PortG: 9-pin input/output port

PortH: 3-pin input/output port

Publication Release Date: Oct 01, 2008

Publication Release Date: Oct 01, 2008

7.18 I²C Synchronous Serial Interface Controller

 I^2C is a two-wire, bi-directional serial bus that provides a simple and efficient method of data exchange between devices. The I^2C standard is a true multi-master bus including collision detection and arbitration that prevents data corruption if two or more masters attempt to control the bus simultaneously.

Serial, 8-bit oriented bi-directional data transfers can be up to 100 Kb/s in Standard-mode, 400 Kb/s in the Fast-mode, or 3.4 Mb/s in the High-speed mode. Only 100kbps and 400kbps modes are supported directly in this chip.

Data transfer is synchronized to SCL signal between a Master and a Slave with **byte-by-byte** basis. Each data byte is 8 bits long. There is one SCL clock pulse for each data bit with the **MSB being transmitted first**. An acknowledge bit follows each transferred byte. Each bit is sampled during the high period of SCL; therefore, the SDA line may be changed only during the low period of SCL and must be held stable during the high period of SCL. A transition on the SDA line while SCL is high is interpreted as a command (START or STOP).

The I²C Master Core includes the following features:

Provide multi-byte transmit operation, up to 4 bytes can be transmitted in a single transfer

Software programmable acknowledge bit.

Arbitration lost interrupt, with automatic transfer cancellation.

Start/Stop/Repeated Start/Acknowledge generation.

Start/Stop/Repeated Start detection.

Bus busy detection.

Supports 7 bit addressing mode.

Software mode I²C.

7.18.1 I2C Serial Interface Control Registers Map

R: read only, W: write only, R/W: both read and write

Register	Offset	R/W/C	Description	Reset Value					
I2C Port0 : I2C_BA = 0xB800_6000 I2C Port1 : I2C_BA = 0xB800_6100

	Reserved				I2C_BUSY	I2C_AL	I2C_TIP			
7	6	5	4	3	2	1	0			
Reserved Tx_NUM		Reserved	IF	IE	I2C_EN					

Bits	Descriptions	
[11]	I2C_RxACK	Received Acknowledge From Slave (Read only) This flag represents acknowledge from the addressed slave. • 0 = Acknowledge received (ACK). • 1 = Not acknowledge received (NACK).
[10]	I2C_BUSY	 I²C Bus Busy (Read only) 0 = After STOP signal detected. 1 = After START signal detected.
[9]	I2C_AL	 Arbitration Lost (Read only) This bit is set when the I²C core lost arbitration. Arbitration is lost when: A STOP signal is detected, but no requested. The master drives SDA high, but SDA is low.
[8]	I2C_TIP	Transfer In Progress (Read only) • 0 = Transfer complete. • 1 = Transferring data. NOTE: When a transfer is in progress, you will not allow writing to any register of the I ² C master core except SWR.

Publication Release Date: Oct 01, 2008

Revision: A2

		Transmit Byte Counts
55.41		These two bits represent how many bytes are remained to transmit. When a byte has been transmitted, the Tx_NUM will decrease 1 until all bytes are transmitted (Tx_NUM = $0x0$) or NACK received from slave. Then the interrupt signal will assert if IE was set.
[5:4]	Tx_NUM	0x0 = Only one byte is left for transmission.
		0x1 = Two bytes are left to for transmission.
		0x2 = Three bytes are left for transmission.
		0x3 = Four bytes are left for transmission.
	IF	Interrupt Flag
		The Interrupt Flag is set when:
		Transfer has been completed.
[2]		 Transfer has not been completed, but slave responded NACK (in multi- byte transmit mode).
		Arbitration is lost.
		NOTE: This bit is read only, but can be cleared by writing 1 to this bit.
		Interrupt Enable
[1]	IE	• 0 = Disable I ² C Interrupt.
		• 1 = Enable I ² C Interrupt.
		I ² C Core Enable
[0]	I2C_EN	• 0 = Disable I ² C core, serial bus outputs are controlled by SDW/SCW.
	_	• 1 = Enable I ² C core, serial bus outputs are controlled by I ² C core.

	•		DIVIDE	R[15:8]					
7	6	5	4	3	2	1	0		
	DIVIDER[7:0]								

Bits	Descriptions	
[15:0]	DIVIDER	Clock Pre-scale Register It is used to pre-scale the SCL clock line. Due to the structure of the I^2C interface, the core uses a 5*SCL clock internally. The pre-scale register must be programmed to this 5*SCL frequency (minus 1). Change the value of the pre-scale register only when the "I2C_EN" bit is cleared. Example: pclk = 32MHz, desired SCL = 100KHz $prescale = \frac{32\ MHz}{5*100\ KHz} - 1 = 63\ (dec\) = 3F\ (hex\)$

Publication Release Date: Oct 01, 2008

Revision: A2

Descriptions	
	Data Transmit Register
-	The I^2C core used 32-bit transmit buffer and provide multi-byte transmit function. Set CSR [Tx_NUM] to a value that you want to transmit. I^2C core will always issue a transfer from the highest byte first. For example, if CSR [Tx_NUM] = 0x3, Tx [31:24] will be transmitted first, then Tx [23:16], and so on.
IX	In case of a data transfer, all bits will be treated as data.
	In case of a slave address transfer, the first 7 bits will be treated as 7-bit address and the LSB represent the R/W bit. In this case,
	LSB = 1, reading from slave
	LSB = 0, writing to slave
	Descriptions Tx

Publication Release Date: Oct 01, 2008

Revision: A2

7.19 Universal Serial Interface Controller (USI)

The USI is a synchronous serial interface performs a serial-to-parallel conversion on data characters received from the peripheral, and a parallel-to-serial conversion on data characters received from CPU. This interface generates an interrupt signal when data transfer is finished and can be cleared by writing 1 to the interrupt flag. The active level of device/slave select signal can be chosen to low active or high active, which depends on the peripheral it's connected. Writing a divisor into DIVIDER register can program the frequency of serial clock output. This master core contains four 32-bit transmit/receive buffers, and can provide burst mode operation. The maximum bits can be transmitted/received is 32 bits, and can transmit/receive data up to four times successive.

The USI (MICROWIRE/SPI) Master Core includes the following features:

Support MICROWIRE/SPI master mode

Full duplex synchronous serial data transfer

Variable length of transfer word up to 32 bits

Provide burst mode operation, transmit/receive can be executed up to four times in one transfer

MSB or LSB first data transfer

Rx and Tx on rising or falling edge of serial clock independently

7.19.1 USI Control Registers Map

		Rese	rved			IE	IF
15	14	13	12	11	10	9	8
SLEEP				Reserved	LSB	Tx_	NUM
7	6	5	4	3	2	1	0
Tx_BIT_LEN					Tx_NEG	Rx_NEG	GO_BUSY

Bits	Descriptions	
		Clock Polarity
[31]	CLK_POL	• 0 = Normal polarity.
		• 1 = Reverse polarity.
		Interrupt Enable
[17]	IE	• 0 = Disable USI Interrupt.
		• 1 = Enable USI Interrupt.
		Interrupt Flag
		• 0 = It indicates that the transfer dose not finish yet.
[16]	IF	ullet 1 = It indicates that the transfer is done. The interrupt flag is set if it was enable.
		NOTE: This bit is read only, but can be cleared by writing 1 to this bit.
		Suspend Interval
		These four bits provide the configuration of suspend interval between two successive transmit/receive in a transfer. The default value is 0x0. When CNTRL [Tx_NUM] = 00, setting this field has no effect on transfer. The desired interval is obtained according to the following equation (from the last falling edge of current SCLK to the first rising edge of next SCLK):
[15:12]	SLEEP	(CNTRL[SLEEP] + 2)*period of SCLK
		SLEEP = 0x0 2 SCLK clock cycle
		SLEEP = 0x1 3 SCLK clock cycle
		SLEEP = 0xe 16 SCLK clock cycle
		SLEEP = 0xf 17 SCLK clock cycle

Publication Release Date: Oct 01, 2008

		Send LSB First
[10]	LSB	0 = The MSB is transmitted/received first (which bit in TxX/RxX register that is depends on the Tx_BIT_LEN field in the CNTRL register).
[10]	LSB	1 = The LSB is sent first on the line (bit TxX [0]), and the first bit received from the line will be put in the LSB position in the Rx register (bit RxX [0]).
		Transmit/Receive Numbers
		This field specifies how many transmit/receive numbers should be executed in one transfer.
[9:8]	Tx_NUM	00 = Only one transmit/receive will be executed in one transfer.
		01 = Two successive transmit/receive will be executed in one transfer.
		10 = Three successive transmit/receive will be executed in one transfer.
		11 = Four successive transmit/receive will be executed in one transfer.
		Transmit Bit Length
	Tx_BIT_LEN	This field specifies how many bits are transmitted in one transmit/receive. Up to 32 bits can be transmitted.
		Tx_BIT_LEN = 0x01 1 bit
[7:3]		$Tx_BIT_LEN = 0x02 2 bits$
		Tx_BIT_LEN = 0x1f 31 bits
		$Tx_BIT_LEN = 0x00 \dots 32 \text{ bits}$
		Transmit On Negative Edge
[2]	Tx_NEG	0 = The SSPTXD signal is changed on the rising edge of SCLK .
		1 = The SSPTXD signal is changed on the falling edge of SCLK .
		Receive On Negative Edge
[1]	Rx_NEG	0 = The SSPRXD signal is latched on the rising edge of SCLK .
		1 = The SSPRXD signal is latched on the falling edge of SCLK .
		Go and Busy Status
		0 = Writing 0 to this bit has no effect.
[0]	GO_BUSY	1 = Writing 1 to this bit starts the transfer. This bit remains set during the transfer and is automatically cleared after transfer finished.
	33_333.	NOTE: All registers should be set before writing 1 to the GO_BUSY bit in the CNTRL register. When a transfer is in progress, writing to any register of the USI master core has no effect.

23	22	21	20	19	18	17	16
	Reserved						
15	14	13	12	11	10	9	8
Reserved							
7	6	5	4	3	2	1	0
Reserved			ASS	SS_LVL	SSR	[1:0]	

Bits	Descriptions	
		Automatic Slave Select
		0 = If this bit is cleared, slave select signals are asserted and de-asserted by setting and clearing related bits in SSR register.
[3] ASS	ASS	1 = If this bit is set, SSPTXD signals are generated automatically. It means that device/slave select signal, which is set in SSR register is asserted by the USI controller when transmit/receive is started by setting CNTRL [GO_BUSY], and is de-asserted after every transmit/receive is finished.
		Slave Select Active Level
503		It defines the active level of device/slave select signal (SSPTXD).
[2]	SS_LVL	• 0 = The SSPTXD slave select signal is active Low .
		• 1 = The SSPTXD slave select signal is active High .
		Slave Select Register If SSR [ASS] bit is cleared, writing 1 to any bit location of this field sets the proper SSPTXD line to an active state and writing 0 sets the line back to inactive state.
[1:0]	SSR	If SSR[ASS] bit is set, writing 1 to any bit location of this field will select appropriate mw_ss_o line to be automatically driven to active state for the duration of the transmit/receive, and will be driven to inactive state for the rest of the time. (The active level of SSPTXD is specified in SSR [SS_LVL]).
		NOTE: This interface can only drive one device/slave at a given time. Therefore, the slave select of the selected device must be set to its active level before starting any read or write transfer.

	Tx[15:8]						
7	6	5	4	3	2	1	0
	Tx[7:0]						

Bits	Descriptions	
		Data Transmit Register
[31:0]	Тх	The Data Transmit Registers hold the data to be transmitted in the next transfer. Valid bits depend on the transmit bit length field in the CNTRL register. For example, if CNTRL [Tx_BIT_LEN] is set to 0x08 and the CNTRL [Tx_NUM] is set to 0x0, the bit Tx0 [7:0] will be transmitted in next transfer. If CNTRL [Tx_BIT_LEN] is set to 0x00 and CNTRL [Tx_NUM] is set to 0x3, the core will perform four 32-bit transmit/receive successive using the same setting (the order is Tx0 [31:0], Tx1 [31:0], Tx2 [31:0], Tx3 [31:0]).
		NOTE: The RxX and TxX registers share the same flip-flops. Which means that what is received from the input data line in one transfer will be transmitted on the output data line in the next transfer if no write access to the TxX register is executed between the transfers.

Publication Release Date: Oct 01, 2008

Revision: A2

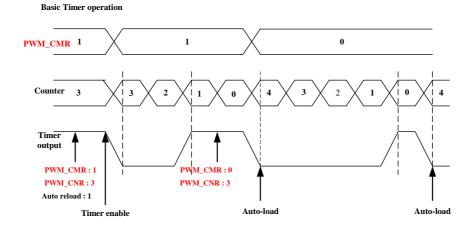

7.20 Pulse Width Modulation (PWM)

This Controller includes 4 channels PWM Timers. They can be divided into two groups. Each group has 1 Prescalar, 1 clock divider, 2 clock selectors, 2 16-bit counters, 2 16-bit comparators, 1 Dead-Zone generator. They are all driven by APB system clock (PCLK) in chip. Each channel can be used as a timer and issue interrupt independently.

Two channels PWM Timers in one group share the same pre-scalar. Clock divider provides each channel with 5 clock sources (1, 1/2, 1/4, 1/8, 1/16). Each channel receives its own clock signal from clock divider which receives clock from 8-bit pre-scalar. The 16-bit counter in each channel receive clock signal from clock selector and can be used to handle one PWM period. The 16-bit comparator compares number in counter with threshold number in register loaded previously to generate PWM duty cycle. The clock signal from clock divider is called PWM clock. Dead-Zone generator utilize PWM clock as clock source. Once Dead-Zone generator is enabled, output of two PWM timers in one group is blocked. Two output pins are all used as Dead-Zone generator output signal to control off-chip power device.

To prevent PWM driving output pin with unsteady waveform, 16-bit counter and 16-bit comparator are implemented with double buffering feature. User can feel free to write data to counter buffer register and comparator buffer register without generating glitch. When 16-bit down counter reaches zero, the interrupt request is generated to inform CPU that time is up. When counter reaches zero, if counter is set as toggle mode, it is reloaded automatically and start to generate next cycle. User can set counter as one-shot mode instead of toggle mode. If counter is set as one-shot mode, counter will stop and generate one interrupt request when it reaches zero. The value of comparator is used for pulse width modulation. The counter control logic changes the output level when down-counter value matches the value of compare register.

7.20.1 Basic Timer Operation

Publication Release Date: Oct 01, 2008

Revision: A2

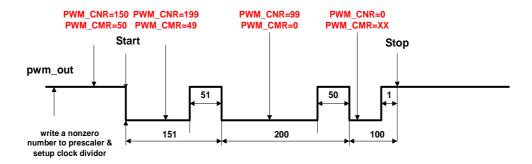

7.20.2 PWM Double Buffering and Reload Automatically

The PWM Timers have a double buffering function, enabling the reload value changed for next timer operation without stopping current timer operation. Although new timer value is set, current timer operation still operate successfully.

The counter value can be written into PWM_CNR0, PWM_CNR1, PWM_CNR2, PWM_CNR3 and current counter value can be read from PWM_PDR0, PWM_PDR1, PWM_PDR2, PWM_PDR3.

The auto-reload operation copies from PWM_CNR0, PWM_CNR1, PWM_CNR2, PWM_CNR3 to down-counter when down-counter reaches zero. If PWM_CNR0~3 are set as zero, counter will be halt when counter count to zero. If auto-reload bit is set as zero, counter will be stopped immediately.

PWM double buffering

7.20.3 Modulate Duty Ratio

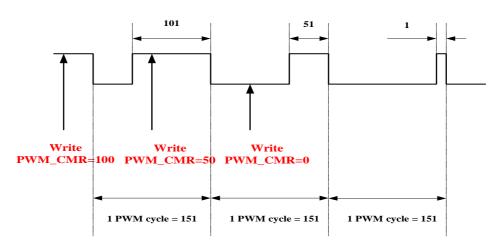

The double buffering function allows PWM_CMR written at any point in current cycle. The loaded value will take effect from next cycle.

Publication Release Date: Oct 01, 2008

Revision: A2

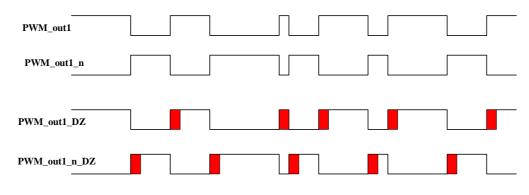

Modulate PWM controller ouput duty ratio(PWM_CNR = 150)

7.20.4 Dead Zone Generator

The PWM Controller is implemented with Dead Zone generator. They are built for power device protection. This function enables generation of a programmable time gap at the rising of PWM output waveform. User can program PWM_PPR [31:24] and PWM_PPR [23:16] to determine the Dead Zone interval.

Note: Us	er can clear eac	h interrupt flag by writing a zero to corresponding bit in PIIR

Publication Release Date: Oct 01, 2008

Revision: A2

7.21 Keypad Interface (KPI)

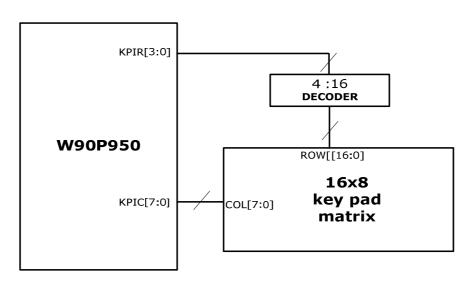

The Keypad Interface (**KPI**) is an APB slave with 4-row scan output and 8-column scan input. KPI scans an array up to 16x8 with an external 4 to 16 decoder. It can also be programmed to scan 8x8 or 4x8 key array. If the 4x8 array is selected then external decoder is not necessary because the scan signals are driven by chip itself. Any 1 or 2 keys in the array that pressed are de-bounced and encoded. If more than 2 keys are pressed, only the keys or apparent keys in the array with the lowest address will be decoded.

The KPI supports 2-keys scan interrupt and specified 3-keys interrupt or chip reset. If the 3 pressed keys matches with the 3 keys defined in **KPI3KCONF**, it will generate an interrupt or chip reset to nWDOG reset output depend on the **ENRST** setting. The interrupt is generated whenever the scanner detects a key is pressed and then after the key is released. The interrupt conditions are 1 key, or 2 keys and no keys.

This chip provides one keypad connecting interface, which is allocated in GPIOC interface and shared with NAND Flash Interface.

The keypad interface has the following features:

- maximum 16x8 array with an external 4 to 16 decoder
- programmable de-bounce time
- low-power wakeup mode for 4x8 array
- programmable three-key reset

Keypad Interface

519

Publication Release Date: Oct 01, 2008

			DBT	C					
7	6	5	4	3	2	1	0		
	PRESCALE								

Bits	Descriptions						
[19]	KPSEL	eypad Select his bit has to write 0 to select GPIOC interface to be the keypad interface.					
[18]	ENKP	eypad Scan Enable etting this bit high enable the key scan function. = Enable keypad scan = Disable keypad scan					
[17:16]	KSIZE	Key Array Size KSIZE Key array size 00 4x8, 3x8, 2x8, 1x8 01 8x8, 7x8, 6x8, 5x8 1x 16x8, 15x8, 14x8, 13x8, 12x8, 11x8, 10x8, 9x8					
[15:8]	DBTC	De-bounce Terminal Count De-bounce counter counts the number of consecutive scans that decoded the same keys. When de-bounce counter is equal to terminal counter, it will generate a key scan interrupt.					
[7:0]	PRESCALE	Row Scan Cycle Pre-scale Value This value is used to pre-scale row scan cycle. The pre-scale counter is clocked by 0.9375MHz clock. Key array scan time = $1.067 \text{us} \times \text{PRESCALE} \times 16 \text{ ROWS}$ Example scan time for PRESCALE = $0 \times \text{FA}$ Scan time = $1.067 \text{us} \times 250 \times 16 = 4.268 \text{ms}$ If de-bounce terminal count = 0×05 , key detection interrupt is fired in approximately 21.34ms . The array scan time can range from 17.07us to 1.118 sec .

8 Electrical Specifications

8.1 Absolute Maximum Ratings

Ambient temperature	-20 °C ~ 70 °C
Storage temperature	-50 °C ~ 125°C
Voltage on any pin	-0.5V ~ 6V
Power supply voltage (Core logic)	-0.5V ~ 2.5V
Power supply voltage (IO Buffer)	-0.5V ~ 4.6V
Injection current (latch-up testing)	100mA
Crystal Frequency	4MHz ~ 30MHz

Publication Release Date: Oct 01, 2008

Revision: A2

8.2 DC Specifications

8.2.1 Digital DC Characteristics

(Normal test conditions: VDD33 = 3.3V+/-10%, VDD18/PLLVDD18 = 1.8V+/-10%, USBVDDC0/USBVDDT0/USBVDDT1= 3.3V+/-5%, TA = $-20~^{\circ}$ C \sim 70 $^{\circ}$ C unless otherwise specified)

SYMBOL	PARAMETER	CONDITION	MIN	TYP	MAX	UNIT
VDD33	Power Supply		2.97	-	3.63	V
VDD18/ PLLVDD18	Power Supply		1.62	ı	1.98	V
USBVDDC0/ USBVDDC1/ USBVDDT0/ USBVDDT1	Power Supply		3.13	ı	3.46	V
V_{IL}	Input Low Voltage		-0.3	-	8.0	V
v_{IH}	Input High Voltage		2.0	-	5.5	V
VT+	Schmitt Trigger positive-going threshold		1.5	-	1.62	V
VT-	Schmitt trigger negative-going threshold		1.14	-	1.27	V
V _{OL}	Output Low Voltage	Depend on driving	-	-	0.4	V
V _{OH}	Output High Voltage	Depend on driving	2.4	-	-	V
I _{IH}	Input High Current	V _{IN} = 2.4 V	-1	-	1	uA
I _{IL}	Input Low Current	$V_{IN} = 0.4 \text{ V}$	-1	-	1	uA
I_{OC}	Operation Current	Note 1	-	340	-	mA
I_{SC}	Standby Current	Note 2	-	100	-	uA

Note1:

This operation current is measured on VDD18 @ 1.8V, and all of IP clocks are enable with CPU clock/system clock @ 200MHz / 100MHz.

Note2:

The standby current is measured on VDD18 @1.8V, and all of IP clocks are disabled with power-down mode, all of GPIO pins are set to output and clock pins keep at 0V.

$ au_{\scriptscriptstyle{FRFM}}$	Full-speed rise/fall time matching	$T_{FRFM} = T_{FR} / T_{FF}$	90%		111.11 %

USB Transceiver: High-Speed AC Electrical Specifications

Symbol	Parameter	Conditions	Min	Тур	Max
T _{HSR}	High-speed driver rise time	$Z_{HSDRV} = 45\Omega$	500ps		900ps
T _{HSF}	High-speed driver fall time	$Z_{HSDRV} = 45\Omega$	500ps		900ps
	High-speed driver waveform requirement		Eye diagram of template 1		
	High-speed receiver waveform requirement		Eye diagram of template 4		
	High and the second second	Data source end	Eye diagram of template 1**		
	High-speed jitter requirement	Receiver end	Eye diagra	olate 4	

^{**} Check "Universal Serial Bus Specification Revision 2.0" in page 133.

Publication Release Date: Oct 01, 2008

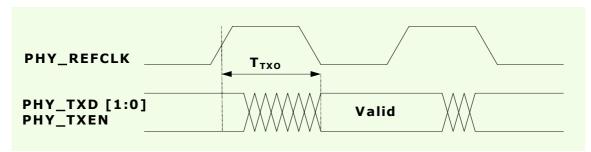

Revision: A2

⁺⁺ Check "Universal Serial Bus Specification Revision 2.0" in page 136.

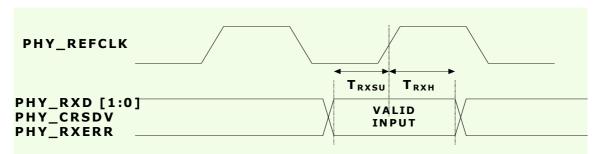

8.3.13 EMC RMII AC Characteristics

The signal timing characteristics conforms to the guidelines specified in IEEE Std. 802.3.

Transmit Signal Timing Relationships at RMII

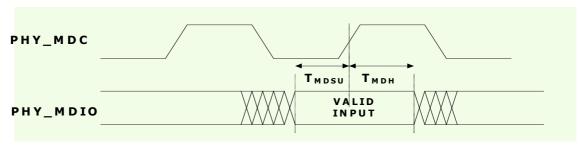

Receive Signal Timing Relationships at RMII

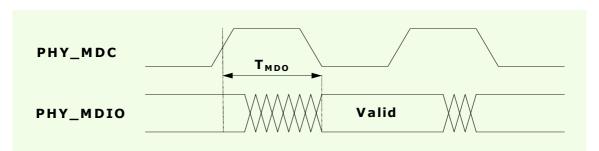

Symbol	Parameter	Min	Max	Unit
T _{T×O}	Transmit Output Delay Time	7	14	ns
T _{RxSU}	Receive Setup Time	4		ns
T _{RxH}	Receive Hold Time	2		ns

Publication Release Date: Oct 01, 2008

Revision: A2

PHY_MDIO Read from PHY Timing

PHY_MDIO Write to PHY Timing

Symbol	Parameter	Min	Max	Unit
T _{MDO}	PHY_MDIO Output Delay Time	0	15	ns
T _{MDSU}	PHY_MDIO Setup Time	5		ns
T _{MDH}	PHY_MDIO Hold Time	5		ns

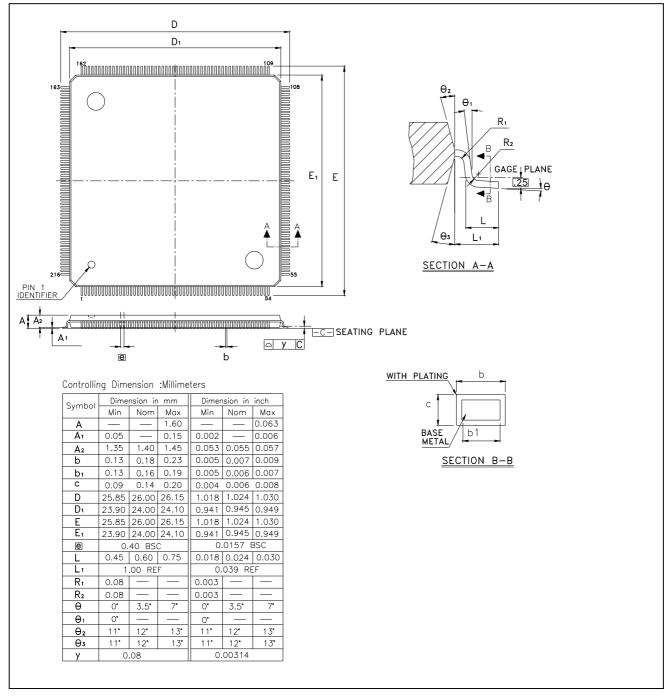

Publication Release Date: Oct 01, 2008

Revision: A2

9 Package Specifications

W90P950CDG LQFP216L (24X24X1.4 mm, footprint 2.0mm)

Publication Release Date: Oct 01, 2008

Revision: A2

10 Revision History

Revision	Date	Comments
А	2008/07/09	First Release
A1	2008/07/18	1. Update Chapter 7.11
		Display size: Maximum size 1024x768
A2	2008/10/01	1. Update Chapter 2
		Add text "PB free"
		2. Update Chapter 4
		Correct typo: KPI_ROW[0], KPI_ROW[1], KPI_ROW[2], KPI_ROW[3]
		Correct Typo: Spelling and grammar check
		4. Update Chapter 9
		Package Specifications

Publication Release Date: Oct 01, 2008

Revision: A2

Important Notice

Nuvoton products are not designed, intended, authorized or warranted for use as components in systems or equipment intended for surgical implantation, atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, or for other applications intended to support or sustain life. Further more, Nuvoton products are not intended for applications wherein failure of Nuvoton products could result or lead to a situation wherein personal injury, death or severe property or environmental damage could occur.

Nuvoton customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Nuvoton for any damages resulting from such improper use or sales.
